

0.5 dB LSB GaAs MMIC 6-BIT DIGITAL VARIABLE GAIN AMPLIFIER, 0.5 - 6 GHz

Typical Applications

The HMC625HFLP5E is ideal for:

- Cellular/3G Infrastructure
- WiBro / WiMAX / 4G
- Microwave Radio & VSAT
- Test Equipment and Sensors
- IF & RF Applications

General Description

The HMC625HFLP5E is a digitally controlled variable gain amplifier which operates from 0.5 - 6 GHz, and can be programmed to provide anywhere from 13.5 dB attenuation, to 18 dB of gain, in 0.5 dB steps. The HMC625HFLP5E delivers noise figure of 6 dB in its maximum gain state, with output IP3 of up to +33 dBm in any state. The dual mode control interface is CMOS/TTL compatible, and accepts either a three wire serial input or a 6 bit parallel word. The HMC625HFLP5E also features a user selectable power up state and a serial output port for cascading other Hittite serial controlled components. The HMC625HFLP5E is housed in a RoHS compliant 5 x 5 mm QFN leadless package, and requires no external matching components.

Electrical Specifications, $T_A = +25$ °C, 50 Ohm System Vdd = +5V, Vs = +5V

Parameter	Min.	Тур.	Max.	Min.	Тур.	Max.	Min.	Тур.	Max.	Units
Frequency Range		500 - 2700		2	2700 - 4000		4000 - 6000		MHz

Serial Control Interface

The HMC625HFLP5E contains a 3-wire SPI compatible digital interface (SERIN, CLK, LE). It is activated when P/S is kept high. The 6-bit serial word must be loaded MSB first. The positive-edge sensitive CLK and LE requires clean transitions. If mechanical switches were used, sufficient debouncing should be provided. When LE is high, 6-bit data in the serial input register is transferred to the attenuator. When LE is high CLK is masked to prevent data transition during output loading.

When P/S is low, 3-wire SPI interface inputs (SERIN, CLK, LE) are disabled and serial input register is loaded asynchronously with parallel digital inputs (D0 - D5). When LE is high, 6-bit parallel data is transferred to the attenuator.

For all modes of operations, the DVGA state will stay constant while LE is kept low.

Parallel Mode (Direct Parallel Mode & Latched Parallel Mode)

Note: The parallel mode is enabled when P/S is set to low.

Direct Parallel Mode - The attenuation state is changed by the Control Voltage Inputs directly. The LE (Latch Enable) must be at a logic high to control the attenuator in this manner.

Latched Parallel Mode - The attenuation state is selected using the Control Voltage Inputs and set while the LE is in the Low state. The attenuator will not change state while LE is Low. Once all Control Voltage Inputs are at the desired states the LE is pulsed. See timing diagram above for reference.

0.5 dB LSB GaAs MMIC 6-BIT DIGITAL VARIABLE GAIN AMPLIFIER, 0.5 - 6 GHz

Power-Up States

If LE is set to logic LOW at power-up, the logic state of PUP1 and PUP2 determines the power-up state of the part per PUP truth table. If the LE is set to logic HIGH at power-up, the logic state of D0-D5 determines the power-up state of the part per truth table. The DVGA latches in the desired power-up state approximately 200 ms after power-up.

Power-On Sequence

The ideal power-up sequence is: GND, Vdd, digital inputs, RF inputs. The relative order of the digital inputs are not important as long as they are powered after Vdd / GND

Absolute Maximum Ratings

RF Input Power ^[1]	11.5 dBm (T = 85 °C)
Digital Inputs (LE, SERIN, CLK, P/S, DO-D5, PUP1, PUP2)	-0.5 to Vdd +0.5V
Controller Bias Voltage (Vdd)	5.6V
Amplifier Bias Voltage (Vcc)	5.5V
Channel Temperature	150 °C
Continuous Pdiss (T = 85 °C) (derate 15.1 mW/°C above 85 °C) ^[1]	0.98 W
Thermal Resistance	66.3 °C/W
Storage Temperature	-65 to +150 °C
Operating Temperature	-40 to +85 °C
ESD Sensitivity (HBM)	Class 1A

[1] At max gain settling

Bias Voltage

Vdd (V)	ldd (Typ.) (mA)
5V	0.12
Vs (V)	ls (Typ.) (mA)
5V	86

Pin Descriptions

Pin Number	Function	Description	Interface Schematic
1	AMPIN	This pin is DC coupled. An off chip DC blocking capacitor is required.	
29	AMPOUT	RF output and DC bias (Vcc) for the output stage of the amplifier.	
2, 3, 13, 28, 30 - 32	GND	These pins and package bottom must be connected to RF/DC ground.	
4, 12	ATTIN, ATTOUT	These pins are DC coupled and matched to 50 Ohms. Blocking capacitors are required. Select value based on lowest frequency of operation.	

0.5 dB LSB GaAs MMIC 6-BIT DIGITAL VARIABLE GAIN AMPLIFIER, 0.5 - 6 GHz

Pin Descriptions

Pin Number	Function	Description	Interface Schematic
5-11	N/C	The pins are not connected internally; however, all data shown herein was measured with these pins connected to RF/DC ground externally.	
14	SEROUT	Serial input data delayed by 6 clock cycles.	Vdd O SEROUT
15, 16	PUP2, PUP1		Vdd O
18 - 23	D5, D4, D3, D2, D1, D0		SERIN
24	P/S		PUP2, '
25	CLK		P/S
26	SERIN		
27	LE		
17	Vdd	Supply Voltage

[1] Reference this number when ordering complete evaluation PCB[2] Circuit Board Material: Arlon 25FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
