Product Description

The TriQuint TGC4403 MMIC combines a frequency doubler with a 3-stage amplifier, operating at input frequencies of 8 - 15 GHz. With greater than 30 dBc suppression measured at the output between the input frequency and doubled frequency, the TGC4403 achieves 22 dBm output power, with 2 dBm input power. This performance makes this doubler ideally suited for Point to Point Radios and Ka Band satellite ground terminal applications. The TGC4403 utilizes TriQuint's robust 0.25um power pHEMT process coupled with 3 layer Metal Inteconnect (3MI) technology. The TGC4403 provides the frequency doubling function in an extremely compact (< 1.8 mm²) chip footprint.

Each device is 100% DC and RF tested on-wafer to ensure performance compliance. The device is available in chip form.

The TGC4403 has a protective surface passivation layer providing environmental robustness.

Lead-free and RoHS compliant.

- 1/ For a median life of 1E+6 hours, Power Dissipation is limited to

$$Pd(max) = (150\text{ °C} - Tbase\text{ °C})/\theta_{jc}.$$

Bias Procedures

Bias-up Procedure

- Vg set to -1.5 V
- Vd set to +5 V
- Vdbl set to -0.8 V
- Adjust Vg more positive until Id is 150 mA. This will be ~ Vg = -0.5 V
- Apply signal to input, Id will increase

Bias-down Procedure

- Turn off signal
- Reduce Vg to -1.5V. Ensure Id ~ 0 mA
- Turn Vdbl to 0V
- Turn Vd to 0V
- Turn Vg to 0V

Assembly Notes

Component placement and adhesive attachment assembly notes:

- Vacuum pencils and/or vacuum collets are the preferred method of pick up.
- Air bridges must be avoided during placement.
- The force impact is critical during auto placement.
- Organic attachment (i.e. epoxy) can be used in low-power applications.
- Curing should be done in a convection oven; proper exhaust is a safety concern.

Reflow process assembly notes:

- Use AuSn (80/20) solder and limit exposure to temperatures above 300°C to 3-4 minutes, maximum.
- An alloy station or conveyor furnace with reducing atmosphere should be used.
- Do not use any kind of flux.
- Coefficient of thermal expansion matching is critical for long-term reliability.
- Devices must be stored in a dry nitrogen atmosphere.

Interconnect process assembly notes:

- Thermosonic ball bonding is the preferred interconnect technique.
- Force, time, and ultrasonics are critical parameters.
- Aluminum wire should not be used.
- Devices with small pad sizes should be bonded with 0.0007-inch wire.
