Functional Block Diagram

General Description

The TAT7466 is a 75 Ω RF Amplifier designed for use up to 1000 MHz. The TAT7466 contains two separate amplifiers for push pull applications. It is fabricated using 6-inch GaAs pHEMT technology to optimize performance and cost. Each amplifier contains on-chip active biasing. The bias current set point of each amplifier is adjustable with a single resistor from the input to ground. The TAT7466 may be flexibly configured for 6 V higher gain applications using external 2:1 transformers, or for direct replacement of familiar 5 V SOIC-8 amplifiers using a 1:1 balun.
