Features

- ❑ Transceiver meets MIL-STD-1553A & B
- ❑ Bipolar Supply $\pm 15V$, Logic Supply +5V
- ❑ Replacement for ACT4487
- ❑ Current source output
- ❑ Monolithic construction
- ❑ Designed for commercial, industrial and aerospace applications
- ❑ Miniature Chipscale Package Bumped Chip Carrier™ (BCC++)

Note: BCC++ and Bumped Chip Carrier are Trademarks of Fujitsu Ltd.

DESCRIPTION

The Aeroflex Plainview ACT 4445 is a monolithic transceiver that provides full compliance to MIL-STD-1553A/B requirements in a small package, with low power consumption.

The ACT 4445 series performs the front-end analog function of inputting and outputting data through a transformer to the MIL-STD-1553 data bus.

Design of this transceiver reflects particular attention to active filter performance. This results in low bit and word error rate with superior waveform purity and minimal zero crossover distortion. Efficient transmitter electrical and thermal design provides low internal power dissipation and heat rise at high as well as low duty cycles.

TRANSMITTER

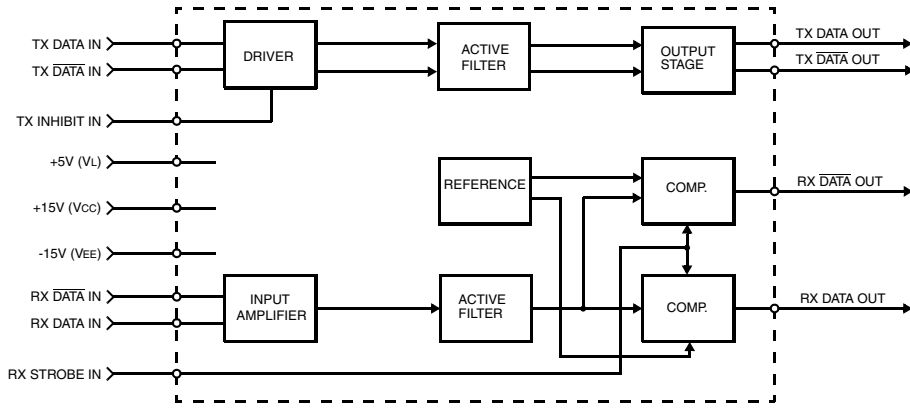

The Transmitter section accepts bi-phase TTL data at the input and when coupled to the data bus with a 1.4:1 transformer the data bus signal produced is 7.5 Volts typical P-P at Point A (See Figure 3 or 4). When both DATA and $\overline{\text{DATA}}$ inputs are held low or high, the transmitter output becomes a high impedance and is “removed” from the line. In addition, an overriding “INHIBIT” input provides for the removal of the transmitter output from the line. A logic “1” signal applied to the “INHIBIT” takes priority over the condition of the data inputs and disables the transmitter (See Transmitter Logic Waveform, Figure 1). The Transmitter may be safely operated for an indefinite period with the bus (Point A) short circuited at 100% duty cycle.

RECEIVER

The Receiver section accepts bi-phase differential data at the input and produces two TTL signals at the output. The outputs are DATA and $\overline{\text{DATA}}$, and represent positive and negative excursions of the input beyond a pre-determined threshold (See Receiver Logic Waveforms - Figure 2).

The pre-set internal thresholds will detect data bus signals, Point A Figure 3 or 4, exceeding 1.20 Volts P-P and reject signals less than 0.6 Volts P-P when used with a transformer (See Figure 3 or 4 for transformer data and typical connection).

A low level at the RX Strobe input inhibits the DATA and $\overline{\text{DATA}}$ outputs. If unused RX Strobe is internally pulled high.

BLOCK DIAGRAM (WITHOUT TRANSFORMER)

Note: DATA and $\overline{\text{DATA}}$ inputs must be complementary waveforms or 50% duty cycle average, with no delays between them, and must be in the same state during off times (both high or low).

- Notes:
- Power on or off, measured from 75KHz to 1MHz at Point A and transformer self impedance of 3KΩ minimum at 1MHz.
 - Power Supplies: ±15VDC ±0.75VDC & +5VDC ±0.25VDC, bypassed by 10 μF (Tantalum recommended) Capacitor minimum. All measurements & specifications apply over the temperature range of -40°C to +85°C (case temperature) unless otherwise specified.
 - When measured as shown per Figure 3 or 4 with ± 10V_{PK}, line to ground, DC to 2MHz
 - Typical power is measured with V_{BUS} at Point A = 7.5V_{P-P}
