

Negative Output Low Drop Out voltage regulator

■ GENERAL DESCRIPTION

The NJM2827 is a negative output low dropout regulator. Advanced bipolar technology achieves low noise, high precision voltage and high ripple rejection.

It has soft-start and shunt SW function. 1.0 μ F Output capacitor and small package can make NJM2827 suitable for portable items.

■ PACKAGE OUTLINE

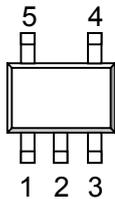

NJM2827F3

■ FEATURES

- Low Dropout Voltage :0.13V (typ.) @ $I_o=60$ mA
- High Precision Output : $\pm 1.5\%$
- High Ripple Rejection :65dB(typ.) @ $f=1$ kHz, $V_o=-7$ V Version
- Output capacitor with 1.0 μ F ceramic capacitor.
- Output Current : $I_o(\text{max.})=100$ mA
- Soft-start Function
- Shunt SW Function
- Internal Thermal Overload Protection
- Internal Short Circuit Current Limit
- Bipolar Technology
- Package Outline SC88A

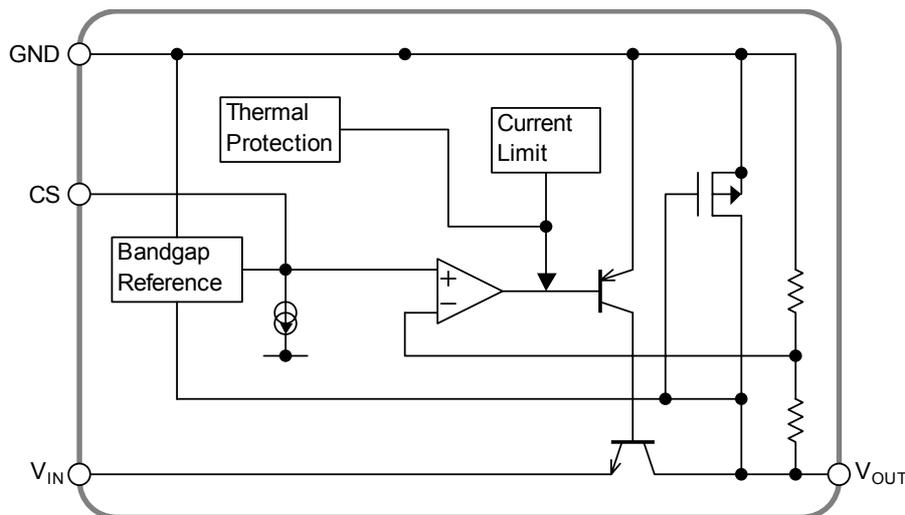

■ PIN CONFIGURATION

- 1.GND
- 2. V_{IN}
- 3. V_{OUT}
- 4.NC
- 5.CS

The above specification is a common specification for all output voltages.

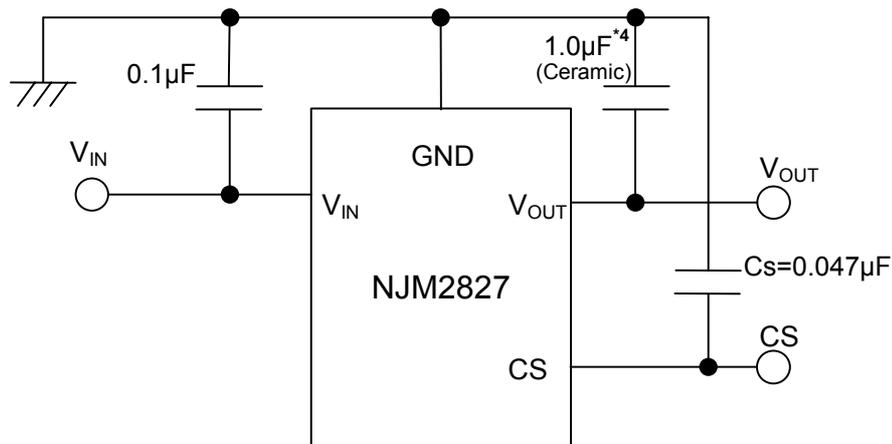

Therefore, it may be different from the individual specification for a specific output voltage.

■ TEST CIRCUIT

*3 $-2.2\text{V} \leq V_o \leq -2.0\text{V}$ version: $C_o = 2.2\mu\text{F}$ (Ceramic)
 $V_o > -2.0\text{V}$ version: $C_o = 4.7\mu\text{F}$ (Ceramic)

■ TYPICAL APPLICATIONS

*4 -2.2V ≤ V_O ≤ -2.0V version: C_O = 2.2µF (Ceramic)
 V_O > -2.0V version: C_O = 4.7µF (Ceramic)

*Input Capacitance C_{IN}

Input capacitance C_{IN} is required to prevent oscillation and reduce power supply ripple for applications with high power supply impedance or a long power supply line.

Use the C_{IN} value of 0.1µF greater to avoid the problem.

C_{IN} should connect between GND and V_{IN} as short as possible.

*Output Capacitance C_O

Output capacitor (C_O) is required for a phase compensation of the internal error amplifier. The capacitance and the equivalent series resistance (ESR) influences stability of the regulator.

This product is designed to work with a low ESR capacitor for the C_O; however, use of recommended capacitance or greater value is essential for stable operation.

Use of a smaller C_O may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

Therefore, use C_O with the recommended capacitance or greater value and connect between V_O terminal and GND terminal with minimal wiring. The recommended capacitance depends on the output voltage. Low voltage regulator requires greater value of the C_O. Thus, check the recommended capacitance for each output voltage.

Use of a greater C_O reduces output noise and ripple output, and also improves transient response of the output voltage against rapid load change.

*Soft-start function

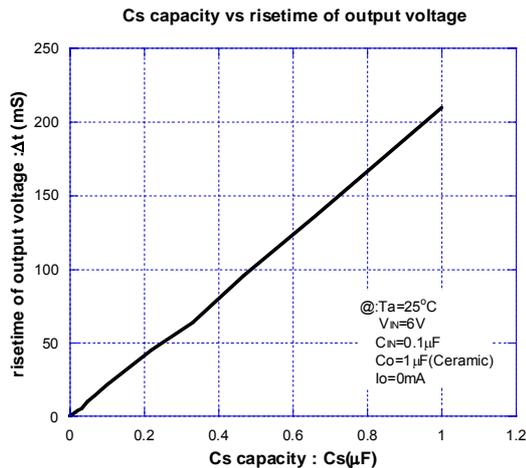

Capacitance C_s connect between CS pin and GND for the following.

- Control at risetime of output voltage.
- Reduces inrush current at output ON.

When the soft start function is not used, CS pin should be open.

1.Cs capacitance vs risetime of output voltage

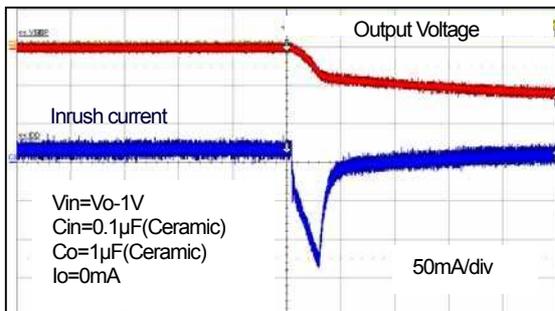

Calculation : risetime of output voltage $\Delta t \cong 213 \times C_s(\mu F)$

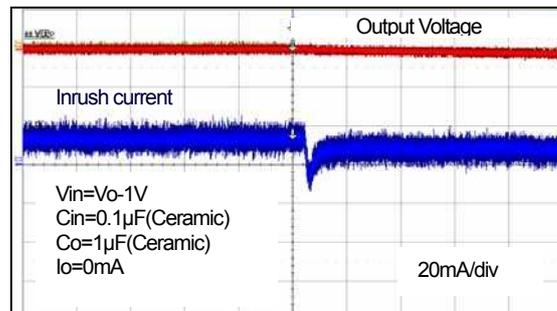

2.Inrush current at control ON

The peak value of the inrush current can be limited according to the capacitance of the C_s .

Inrush current wave :

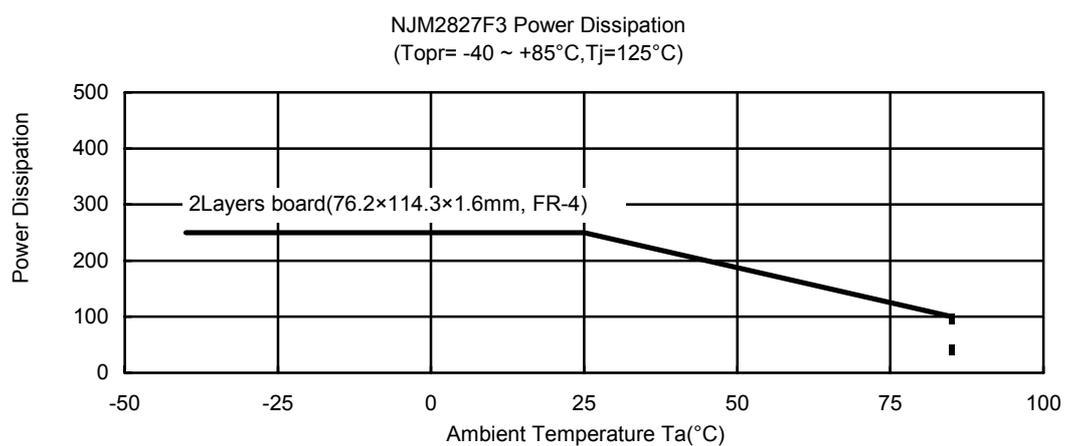

Inrush Peak Current=150mA(Cs=Open)

Inrush Peak Current=20mA(Cs=0.0047μF)

* This characteristic is one example. It is necessary to examine the characteristic with an actual circuit because there is an influence by the characteristic such as output voltage/output capacitor.
