

## POWER FACTOR CONTROLLER

### ■ GENERAL DESCRIPTION

The **NJM2375/A** are active power factor controllers, which limit the harmonic current resulting from the power supply block of electrical devices.

They include a startup timer, an one quadrant multiplier, a zero current detector to ensure critical condition operation, a transconductance error amplifier, high precision reference, a current sensing comparator, and a totem pole output ideally suited for driving a power MOSFET.

They also contain protection circuits for overvoltage, cycle-by-cycle overcurrent, and maximum peak current.

The startup threshold of **NJM2375A** is lower than that of **NJM2375**.

### ■ PACKAGE OUTLINE

**NJM2375D/AD**

**NJM2375M/AM**

**NJM2375V/AV**

**NJM2375L/AL**

### ■ FEATURES

- Overvoltage Comparator Eliminates Runaway Output Voltage
- Internal Quick Start
- Internal Startup Timer
- One Quadrant Multiplier
- Zero Current Detector
- High Precision Reference ( $\pm 2\%$ )
- Totem Pole Output with High State Clamp
- Undervoltage Lockout  
(Startup Threshold/**NJM2375**:13V typ., **NJM2375A**:10.4V typ.)
- Low Startup and Operating Current
- Bipolar Technology
- Package Outline DIP8,DMP8,SSOP14,SIP8

### ■ PIN CONFIGURATION

● NOTES

\*1 : Adjust  $V^+$  above the startup threshold before setting to 12V.

$$*2 : K = \frac{V_{th(max)}}{V_M \times (V_{comp} - V_{th(M)})}$$

\*3 : This parameter is measured with  $V_{FB}=0V$ , and  $V_M=3.0V$ .

\*4 : Do not supply higher voltage above the zener voltage to 8pin, because the internal zener diode protects the IC from surge.
