Notes on Ratings and Characteristics

1.0 Voltage Grade Table

Voltage Grade	V_{DRM} V_{DSM} V_{RRM} V	V_{RSM} V	V_D V_R DC V
12	1200	1300	820
14	1400	1500	930
16	1600	1700	1040
18	1800	1900	1150

2.0 Extension of Voltage Grades

This report is applicable to other voltage grades when supply has been agreed by Sales/Production.

3.0 De-rating Factor

A blocking voltage de-rating factor of 0.13%/°C is applicable to this device for T_{vj} below 25°C.

4.0 Repetitive dv/dt

Standard dv/dt is 1000V/μs.

5.0 Snubber Components

When selecting snubber components, care must be taken not to use excessively large values of snubber capacitor or excessively small values of snubber resistor. Such excessive component values may lead to device damage due to the large resultant values of snubber discharge current. If required, please consult the factory for assistance.

6.0 Rate of rise of on-state current

The maximum un-primed rate of rise of on-state current must not exceed 300A/μs at any time during turn-on on a non-repetitive basis. For repetitive performance, the on-state rate of rise of current must not exceed 150A/μs at any time during turn-on. Note that these values of rate of rise of current apply to the total device current including that from any local snubber network.

7.0 Gate Drive

The nominal requirement for a typical gate drive is illustrated below. An open circuit voltage of at least 30V is assumed. This gate drive must be applied when using the full di/dt capability of the device.

The magnitude of I_{GM} should be between five and ten times I_{GT} , which is shown on page 2. Its duration (t_{p1}) should be 20μs or sufficient to allow the anode current to reach ten times I_L , whichever is greater. Otherwise, an increase in pulse current could be needed to supply the necessary charge to trigger. The 'back-porch' current I_G should remain flowing for the same duration as the anode current and have a magnitude in the order of 1.5 times I_{GT} .

8.0 Computer Modelling Parameters

8.1 Thyristor Dissipation Calculations

$$I_{AV} = \frac{-V_{T0} + \sqrt{V_{T0}^2 + 4 \cdot ff^2 \cdot r_T \cdot W_{AV}}}{2 \cdot ff^2 \cdot r_T} \quad \text{and:} \quad W_{AV} = \frac{\Delta T}{R_{th}}$$

$$\Delta T = T_{j \max} - T_K$$

Where $V_{T0} = 0.85 \text{ V}$, $r_T = 0.27 \text{ m}\Omega$ for the thyristor and $V_{T0} = 0.72 \text{ V}$, $r_T = 0.143 \text{ m}\Omega$ for the diode.

R_{th} = Supplementary thermal impedance, see table below and

ff = Form factor, see table below.

Sine wave	3.98	2.778	2.22	1.879	1.57		

8.2 Calculating thyristor V_T using ABCD Coefficients

The on-state characteristic I_T vs. V_T , on page 6 is represented in two ways;

- the well established V_{T0} and r_T tangent used for rating purposes and
- a set of constants A, B, C, D, forming the coefficients of the representative equation for V_T in terms of I_T given below:

$$V_T = A + B \cdot \ln(I_T) + C \cdot I_T + D \cdot \sqrt{I_T}$$

The constants, derived by curve fitting software, are given below for both hot and cold characteristics. The resulting values for V_T agree with the true device characteristic over a current range, which is limited to that plotted.

25°C Coefficients		125°C Coefficients	
A	0.7860338	A	-0.099137717
B	9.929062×10^{-3}	B	0.1987038
C	1.94704×10^{-4}	C	4.23812×10^{-4}
D	7.409213×10^{-3}	D	-0.01453705

8.3 D.C. Thermal Impedance Calculation

$$r_t = \sum_{p=1}^{p=n} r_p \cdot \left(1 - e^{-\frac{t}{\tau_p}} \right)$$

Where $p = 1$ to n

- n = number of terms in the series and
 t = Duration of heating pulse in seconds.
 r_t = Thermal resistance at time t .
 r_p = Amplitude of p_{th} term.
 τ_p = Time Constant of r_{th} term).

The coefficients for this device are shown in the tables below:

D.C.					
Term	1	2	3	4	5
r_p	0.07972	3.64310×10^{-3}	4.87795×10^{-3}	1.91134×10^{-3}	2.16406×10^{-3}
τ_p	4.46119	0.71394	0.06312	5.07740×10^{-3}	6.07258×10^{-3}

9.0 Reverse recovery ratings

- (i) Q_{rr} is based on 50% I_{RM} chord as shown in Fig. 1

Fig. 1

- (ii) Q_{rr} is based on a $150 \mu s$ integration time i.e.

$$Q_{rr} = \int_0^{150 \mu s} i_{rr} \cdot dt$$

- (iii)

$$K \text{ Factor} = \frac{t_1}{t_2}$$
