## LPC-E2124 Board

### Introduction

The **LPC2124** are based on a 16/32 bit ARM7TDMI-S™ CPU with real-time emulation and embedded trace support, together with 128/256 kilobytes (kB) of embedded high speed flash memory. A 128-bit wide memory interface and a unique accelerator architecture enable 32-bit code execution at maximum clock rate. For critical code size applications, the alternative 16-bit Thumb Mode reduces code by more than 30% with minimal performance penalty.

With their compact 64 pin package, low power consumption, various 32-bit timers, 4-channel 10-bit ADC, PWM channels and 46 GPIO lines with up to 9 external interrupt pins these microcontrollers are particularly suitable for industrial control, medical systems, access control and point-of-sale. With a wide range of serial communications interfaces, they are also very well suited for communication gateways, protocol converters and embedded soft modems as well as many other general-purpose applications.

The **LPC-E2124** Development board is designed to evaluate LPC2124 processor. It has the following features:

- CS8900 Ethernet interface
- two general purpose buttons
- potentiometer connected to analog input 0
- Dallas i-button interface
- 24LC515 EEPROM for external web storage
- standard JTAG connector with ARM2x10 pin layout for programming/debugging with ARM-JTAG
- two on board voltage regulators 1.8V and 3.3V with up to 800mA current
- single power supply, +5VDC required
- three LAN status LEDs, three general purpose status LEDs
- power supply filtering capacitor
- USB to RS232 interface
- RESET circuit with external control of Philips ISP utility via USB/RS232
- RESET button
- DBG jumper for JTAG enable
- BSL jumper for bootloader enable
- JRST jumper for enable/disable external RESET control by RS232
- 14.7456 Mhz crystal
- extension header for all uC ports
- PCB: FR-4, 1.5 mm (0,062"), green soldermask, white silkscreen component print
- Dimensions: 80x90 mm (3.15x3.55")

The purpose of this guide is to describe LPC-P2124 Development board.

## LPC E2129 Hardware description

### Peripherals

Unit	Description
Ethernet connector	RJ45 Ethernet connector
USB Connector	USB connector type B
JTAG Connector	2x10 0,1" step connector for programming with ARM-JTAG.
Dallas Connector	Interface to Dallas device connected to P0.24 / TD2 (PIN 5).
Buttons	Two buttons connected to interrupt ports Button 1 - P0.15 / RI1 / EINT2 (PIN 45) Button 2 - P0.9 / RXD1 / PWM6 / EINT3 (PIN 34)
Leds	Red status led (L1) connected to P0.8 / TXD1 / PWM4 (PIN 33) Green status led (L2) connected to P0.10 / RTS1 / CAP1.0 (PIN 35) Yellow status led (L3) connected to P0.11 / CTS1 / CAP1.1 (PIN 37) and three LAN status leds

### Technical characteristics

Parameter	Description
Voltage Supply	+ 5.0VDC from USB
CPU	LPC2124
Crystals	Crystal 1 - Q1 - 14,745 MHz crystal Crystal 2 - Q2 - 20 MHz crystal Crystal 3 - Q4 - 6 MHz crystal
Board dimensions	80x90 mm (3.15x3.55")
PCB	FR-4, 1.5 mm (0,062"), green soldermask, white silkscreen component print
Operating Temperature	from 0°C to 70°C

### JTAG Connector

Pin / Name	Connected to:	Functionality
------------	---------------	---------------

1 - VCC	VCC	-
2 - VCC	VCC	-
3 - TRST	PIN 20	P1.31 / TRST
4 - GND	GROUND	-
5 - TDI	PIN 60	P1.28 / TDI
6 - GND	GROUND	-
7 - TMS	PIN 52	P1.30 / TMS
8 - GND	GROUND	-
9 - TCK	PIN 56	P1.29 / TCK
10 - GND	GROUND	-
11 - RTCK	PIN 24	P1.26 / RTCK
12 - GND	GROUND	-
13 - TDO	PIN 64	P1.27 / TDO
14 - GND	GROUND	-
15 - RST	PIN 57	RST
16 - GND	GROUND	-
17 - -	no connected	-
18 - GND	GROUND	-
19 - -	no connected	-
20 - GND	GROUND	-

### USB Connector

Pin / Name	Connected to:	Functionality
1 - +5V	+5V/DC	-
2 - USBDM	FT232BM(PIN 8)	USBDM
3 - USBDP	FT232BM(PIN 7)	USBDP
4 - GND	GROUND	-

### Ethernet Connector

#### ETHERNET

Pin / Name	Connected to:	Functionality
1 - TD+	CS8900A PIN 87	TXD+
2 - TD-	CS8900A PIN 88	TXD-
3 - RD+	CS8900A PIN 91	RXD+
4 -	not connected	-
5 -	not connected	-
6 - RD-	CS8900A PIN 92	RXD-
7 -	not connected	-

8 - | not connected | -

## Dallas Connector

Pin / Name	Connected to:	Functionality
1 - DALLAS	PIN 5	P0.24 / TD2
2 - GND	GROUND	-

## Extension ports

Pin / Name	Connected to:	Functionality
PIN 1	PIN 16	P1.16 / TRACEPTK0
PIN 2	PIN 22	P0.2 / SCL / CAP0.0
PIN 3	PIN 12	P1.17 / TRACEPTK1
PIN 4	PIN 26	P0.3 / SDA / MAT0.0 / EINT1
PIN 5	PIN 8	P1.18 / TRACEPTK2
PIN 6	PIN 45	P0.15 / RI1 / EINT2
PIN 7	PIN 4	P1.19 / TRACEPTK3
PIN 8	PIN 34	P0.09 / RXD1 / PWM6 / INT3
PIN 9	PIN 48	P1.20 / TRACESYNC
PIN 10	PIN 33	P0.8 / TXD1 / PWM4
PIN 11	PIN 44	P1.21 / PIPESTAT0
PIN 12	PIN 35	P0.10 / RTS1 / CAP1.0
PIN 13	PIN 40	P1.22 / PIPESTAT1
PIN 14	PIN 37	P0.11 / CTS1 / CAP1.1
PIN 15	PIN 36	P1.23 / PIPESTAT2
PIN 16	PIN 41	P0.14 / DCD1 / EINT1
PIN 17	PIN 32	P1.24 / TRACECLK
PIN 18	PIN 9	P0.25 / RD1
PIN 19	PIN 28	P1.25 / EXTIN0
PIN 20	PIN 10	TD1
PIN 21	PIN 24	P1.26 / RTCK
PIN 22	PIN 11	P0.27 / AINT0 / CAP0.1 / MAT0.1
PIN 23	PIN 64	P1.27 / TDO
PIN 24	PIN 13	P0.28 / AINT1 / CAP0.2 / MAT0.2
PIN 25	PIN 60	P1.28 / TDI
PIN 26	PIN 14	P0.29 / AINT2 / CAP0.3 / MAT0.3
PIN 27	PIN 56	P1.29 / TCK
PIN 28	PIN 15	P0.30 / AINT3 / EINT3 / CAP0.0
PIN 29	PIN 52	P1.30 / TMS
PIN 30	PIN 57	RST

PIN 31	PIN 20	P1.31 / TRST
PIN 32	+5V USB	-
PIN 33	GROUND	-
PIN 34	+3.3V	-

## Jumpers

Jumpers	Position	Description
Jumper 1 (L1)		Red led is not connected.
		Red led connected to P0.8 / TXD1 / PWM4 (PIN 33).
Jumper 2 (L2)		Green led is not connected.
		Green led connected to P0.10 / RTS1 / CAP1.0 (PIN 35).
Jumper 3 (L3)		Yellow led is not connected.
		Yellow led connected to P0.11 / CTS1 / CAP1.1 (PIN 37).
Jumper 4 (JRST) Jumper 5 (BSL)	 	Disable ICSP programming.
	 	Enable ICSP programming - via USB Connector ( virtual COM port).
Jumper 6 (DBG)		Disable JTAG programming.
		Enable JTAG programming.

# LPC-E2124 Board

## Programming: RS232

### RS232 Connector

RS232		Pin / Name	Description		
CD	1	6	DSR	1 - CD	Carrier Detected.
RXD	2	7	RTS	2 - RXD	Received Data.
TXD	3	8	CTS	3 - TXD	Transmitted Data.
DTR	4	9	RI	4 - DTR	Data Terminal Ready.
GND	5			5 - GND	Signal Ground.
				6 - DSR	Data Set Ready.
				7 - RTS	Request to Send.
				8 - CTS	Clear to Send.
				9 - RI	Ring Indicator.

### Register description

Register	Address	Function
U0RBR	0xE000C000 DLAB = 0	<b>Receiver Buffer Register.</b> Input data buffer.
U0THR	0xE000C000 DLAB = 0	<b>Transmit Holding Register.</b> Output data buffer.
U0DLL	0xE000C000 DLAB = 1	<b>Divisor Latch LSB.</b>
U0DLM	0xE000C000 DLAB = 1	<b>Divisor Latch MSB.</b>
U0IER	0xE000C004 DLAB = 0	<b>Interrupt Enable Register.</b>
U0IIR	0xE000C008	<b>Interrupt ID Register.</b>
U0FCR	0xE000C008	<b>FIFO Control Register.</b>

U0LCR	0xE000C00C	Line Control Register.
U0LSR	0xE000C014	Line Status Register.
U0SCR	0xE000C01C	Scratch Pad Register.
U0TER	0xE000C030	Transmit Enable.

## 1.Initialization

### 1.1. Set Line Control Register

U0LCR	Function	Description	Reset Value
1:0	Word Length Select	00: 5 bit character length 01: 6 bit character length 10: 7 bit character length 11: 8 bit character length	0
2	Stop Bit Select	0: 1 stop bit 1: 2 stop bits (1.5 if U0LCR[1:0]=00)	0
3	Parity Enable	0: Disable parity generation and checking 1: Enable parity generation and checking	0
5:4	Parity Select	00: Odd parity 01: Even parity 10: Forced "1" stick parity 11: Forced "0" stick parity	0
6	Break Control	0: Disable break transmission 1: Enable break transmission. Output pin UART0 TxD is forced to logic 0 when U0LCR6 is active high.	0

7	Divisor Latch Access Bit	0: Disable access to Divisor Latches 1: Enable access to Divisor Latches	0
---	--------------------------	-----------------------------------------------------------------------------	---

## 1.2. UART0 Baudrate Calculation

The U0DLL and U0DLM registers together form a 16 bit divisor where U0DLL contains the lower 8 bits of the divisor and U0DLM contains the higher 8 bits of the divisor.

```
divisor = pclk / (16 * baud);
```

## 1.3. Set Functionality to pins

Set functionality to P0.0 -> TX0 and P0.1 -> RXD0

## 2. RS232 Communication

### 2.1. Write to RS232

Use follow algorithm to send data:

- fill U0THR register with data to write
- wait shift all data
- clear interrupt flag

### 2.2. Read from RS232

Use follow algorithm to receive data:

- wait read all data
- clear interrupt flag
- get data from U0RBR

## 3. Example

*Initialize:*

```
//set Line Control Register (8 bit, 1 stop bit, no parity, enable DLAB)
U0LCR_bit.WLS = 0x3;    //8 bit
U0LCR_bit.SBS = 0x0;    //1 stop bit
U0LCR_bit.PE = 0x0;     //no parity
U0LCR_bit.DLAB = 0x1;   //enable DLAB

//divisor
-----
```

```
UODLL = Pclk / (16 * baud); //low bite
UODLM = Pclk / (16 * baud)>>8; //high bite
UOLCR &= ~0x80;
```

```
//set functionality to pins: port0.0 -> TX0, port0.1 -> RXD0
PINSEL0_bit.P0_0 = 0x1;
PINSEL0_bit.P0_1 = 0x1;
```

#### **Read Data:**

```
//when UOLSR_bit.DR is 1 - UORBR contains valid data
while (UOLSR_bit.DR == 0);
return UORBR;
```

#### **Write Data:**

```
//when UOLSR_bit.THRE is 1 - UOTHR contains valid data.
while (UOLSR_bit.THRE == 0);
UOTHR = ch0;
```

0	IMSEC	When one, an increment of the Second value generates an interrupt.
1	IMMIN	When one, an increment of the Minute value generates an interrupt.
2	IMHOUR	When one, an increment of the Hour value generates an interrupt.
3	IMDOM	When one, an increment of the Day of Month value generates an interrupt.
4	IMDOW	When one, an increment of the Day of Week value generates an interrupt.
5	IMDOY	When one, an increment of the Day of Year value generates an interrupt.
6	IMMON	When one, an increment of the Month value generates an interrupt.
7	IMYEAR	When one, an increment of the Year value generates an interrupt.

### 1.3. Start the Real Time Clock

CLKEN (bit 0 from CCR Register) Enable/Disable Real Time Clock

0 - Disable Real Time Clock

1 - Enable Real Time Clock

## 2. Example

### Initialize:

```

CCR_bit.CLKEN = 0;      //rtc disable
CCR_bit.CLKSRC = 1;    //set external 32kHz oscillator
CCR_bit.CTCRST = 0;   //disable reset
CCR_bit.CTTEST = 0;   //disable test
AMR          = 0;     //initialize interrupt mask register of RTC
CIIR_bit.IMSEC = 1;   //enable interrupt every seconds
ILR          = 3;     //clear all interrupt of RTC
CCR_bit.CLKEN = 1;    //rtc enable

```

## LPC-E2124 Board

### Programming: Blinking LED

#### GPIO Register map

Generic name	Description
IOPIN	<b>GPIO Port Pin value register.</b> The current state of the GPIO configured port pins can always be read from this register, regardless of pin direction and mode. Activity on non-GPIO configured pins will not be reflected in this register.
IOSET	<b>GPIO Port Output set register.</b> This register controls the state of output pins in conjunction with the IOCLR register. Writing ones produces highs at the corresponding port pins. Writing zeroes has no effect.
IODIR	<b>GPIO Port Direction control register.</b> This register individually controls the direction of each port pin.
IOCLR	<b>GPIO Port Output clear register.</b> This register controls the state of output pins. Writing ones produces lows at the corresponding port pins and clears the corresponding bits in the IOSET register. Writing zeroes has no effect.

#### Pin Connect Block Register Map

Register name	Description
PINSEL0	PINSEL0 Pin function select register 0 (from P0.0 to P0.15)
PINSEL1	PINSEL1 Pin function select register 1 (from P0.16 to P0.31)
PINSEL2	PINSEL2 Pin function select register 2

### 1. Initialization (general case)

#### 1.1. Set first functionality to port

```
PINSEL1 = 0x00; //set first functionality to port (from P0.0 to P0.15)
```

## 1.2. Set port which is connected to LED as output

```
IOODIR = 0xFF;    //set P0.0 to P0.15 port as output
```

## 2. Led blink (general case)

```
IOOCLR = 0xFF;    // set P0.0 - P0.15 to low  
IOOSET = 0xFF;    // set P0.0 - P0.15 to high
```

## 3. Example - blink led, which is connected to P0.8

### //Initialization

```
PINSEL0_bit.P0_8 = 0x0; // set first functionality to port  
IOODIR_bit.P0_8 = 0x1; // set P0.8 port to output  
IOOSET_bit.P0_8 = 0x1; // set P0.8 port to high
```

### //loop forever

```
while(1)  
{  
    Delay(1000);           // Simple delay  
    IOOSET_bit.P0_8 = 0x1; // set P0.8 port to high  
    Delay(1000);           // Simple delay  
    IOOCLR_bit.P0_8 = 0x1; // set P0.8 port to high  
}
```
