#### **Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE**.** Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

# **MRF89XA**

# **Ultra Low-Power, Integrated ISM Band Sub-GHz Transceiver**

# **Features**

- Fully integrated ultra low-power, sub-GHz transceiver
- Wide-band half-duplex transceiver
- Supports proprietary sub-GHz wireless protocols
- Simple 4-wire SPI-compatible interface
- CMOS/TTL-compatible I/Os
- On-chip oscillator circuit
- Dedicated clock output
- Supports power-saving modes
- Operating voltage: 2.1-3.6V
- Low-current consumption, typically:
	- 3 mA in RX mode
	- $-25$  mA  $@ + 10$  dBm in TX mode
	- $0.1 \mu$ A (Typical) and 2  $\mu$ A (Maximum) in Sleep mode
- Supports Industrial temperature range (-40ºC to +85ºC)
- Complies with ETSI EN 300-220 and FCC part 15
- Small, 32-pin TQFN package

# **RF/Analog Features**

- Supports ISM band sub-GHz frequency ranges: 863–870, 902–928 and 950–960 MHz
- Modulation technique: Supports FSK and OOK
- Supports high data rates: Up to 200 kbps, NRZ coding
- Reception sensitivity: Down to -107 dBm at 25 kbps in FSK, -113 dBm at 2 kbps in OOK
- RF output power: +12.5 dBm programmable in eight steps
- Wide Received Signal Strength Indicator (RSSI), dynamic range: 70 dB from RX noise floor
- Signal-ended RF input/output
- On-chip frequency synthesizer
- Supports PLL loop filter with lock detect
- Integrated Power Amplifier (PA) and Low Noise Amplifiers (LNA)
- Channel filters
- On-chip IF gain and mixers
- Integrated low-phase noise VCO

# **Baseband Features**

- Packet handling feature with data whitening and automatic CRC generation
- Incoming sync word (pattern) recognition
- Built-in bit synchronizer for incoming data, and clock synchronization and recovery
- 64-byte transmit/receive FIFO with preload in Stand-by mode
- Supports Manchester encoding/decoding techniques

# **Typical Applications**

- Home/industrial/building automation
- Remote wireless control
- Wireless PC peripherals
- Remote keyless entry
- Wireless sensor networks
- Vehicle sensor monitoring
- Telemetry
- Data logging systems
- Wireless alarm
- Remote automatic meter reading
- Security systems for home/industrial environments
- Automobile immobilizers
- Sports and performance monitoring
- Wireless toy controls
- Medical applications

# **General Description**

The MRF89XA is a single chip, multi-channel FSK/OOK transceiver capable of operating in the 863-870 MHz and 902-928 MHz license-free ISM frequency bands, as well as the 950-960 MHz frequency band. The low-cost MRF89XA is optimized for very low-power consumption. It incorporates a baseband modem with data rates up to 200 kbps. Data handling features include a 64-byte FIFO, packet handling, automatic CRC generation and data whitening.

Its highly integrated architecture allows for minimum external component count while still maintaining design flexibility.

All critical RF and baseband functions are integrated in the MRF89XA, which minimizes the external component count and reducing design time. The RF communication parameters are made programmable and most of them may be dynamically set. A microcontroller, RF SAW filter, 12.8 MHz crystal and a few passive components are required to create a complete, reliable radio function. The MRF89XA uses several low-power mechanisms to reduce overall current consumption and extend battery life. Its small size and low-power consumption makes the MRF89XA ideal for a wide variety of short range radio applications. The MRF89XA complies with European (ETSI EN 300-220) and United States (FCC Part 15.247 and 15.249) regulatory standards.

# **TO OUR VALUED CUSTOMERS**

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **[docerrors@microchip.com](mailto:docerrors@microchip.com)** or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

# **Most Current Data Sheet**

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

**http://www.microchip.com**

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

#### **Errata**

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

• Microchip's Worldwide Web site; **[h](http://www.microchip.com)ttp://www.microchip.com**

• Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

# **Customer Notification System**

Register on our web site at **[www.microchip.com](http://www.microchip.com)** to receive the most current information on all of our products.

# **MRF89XA**

**NOTES:**

# <span id="page-6-0"></span>**1.0 OVERVIEW**

Microchip's MRF89XA is a fully integrated, half-duplex, sub-GHz transceiver. This low-power, single chip FSK and OOK baseband transceiver supports:

- Superheterodyne architecture
- Multi-channel, multi-band synthesizer with Phase Locked Loop (PLL) for easy RF design
- Power Amplifier (PA)
- Low Noise Amplifier (LNA)
- I/Q two stage down converter mixers
- I/Q demodulator, FSK/OOK
- Baseband filters and amplifiers

The simplified block diagram of the MRF89XA is illustrated in [Figure 1-1.](#page-7-0)

The MRF89XA is a good option for low-cost, highvolume, low data rate (≤200 kbps), and two-way short range wireless applications. This device is a single chip FSK and OOK transceiver capable of operating in the 863-870 MHz and 902-928 MHz license-free ISM frequency bands, and the 950-960 MHz frequency band.

The low-cost MRF89XA is optimized for very low-power consumption (3 mA in Receive mode). It incorporates a baseband modem with data rates up to 200 kbps in FSK and 32 kbps in OOK. Data handling features include a 64-byte FIFO, packet handling, automatic CRC generation and data whitening. The device also supports Manchester coding techniques. Its highly integrated architecture allows for minimum external component count while maintaining design flexibility. All<br>major RF communication parameters are major RF communication parameters are programmable and most of them may be dynamically set.

The MRF89XA supports a stable sensitivity and linearity characteristics for a wide supply range and is internally regulated. The frequency synthesizer of the MRF89XA is a fully integrated integer-N type PLL. The oscillator circuit provided on the MRF89XA device provides the reference clock for the PLL. The frequency synthesizer requires only five external components which includes PLL loop filter and the VCO tank circuit. Low-phase noise provides for excellent adjacent channel rejection capability, Bit Error Rate (BER) and longer communication range.

The high-resolution PLL allows:

- Usage of multiple channels in any of the bands
- Rapid settling time, which allows for faster frequency hopping

A communication link in most applications can be created using a low-cost 12.8 MHz crystal, a SAW filter and a low-cost microcontroller. The MRF89XA provides a clock signal for the microcontroller. The transceiver can be interfaced with many popular Microchip PIC® microcontrollers through a 4-wire Serial Peripheral Interface (SPI), interrupts (IRQ0 and IRQ1), PLL lock and clock out. The interface between the microcontroller and MRF89XA (a typical MRF89XA RF node) is illustrated in [Figure 1-2.](#page-8-0)

The MRF89XA supports the following digital data processing features:

- Received Signal Strength Indicator (RSSI)
- Sync word recognition
- Packet handling
- Interrupt and flags
- Different operating Modes (Continuous, Buffer and Packet)
- Data filtering/whitening/encoding
- Baseband power amplifier
- 64-byte TX/RX FIFO

The role of the digital processing unit is to interface the data to/from the modulator/demodulator and the microcontroller access points (SPI, IRQ and DATA pins). It also controls all of the Configuration registers. The receiver's Baseband Bandwidth (BBBW) can be programmed to accommodate various deviations and data rates requirements.

An optional Bit Synchronizer (BitSync) is provided, to supply a synchronous clock and data stream to a companion microcontroller in Continuous mode, or to fill the FIFO with glitch-free data in Buffered mode. The transceiver is integrated with different power-saving modes and a software wake-up time through the host microcontroller to keep track of the activities, which reduces the overall current consumption and extends the battery life. The small size and low-power consumption of the MRF89XA makes it ideal for various short range radio applications.

The MRF89XA complies with European (ETSI EN 300- 220) and United States (FCC Part 15.247 and 15.249) regulatory standards.

# **MRF89XA**

**NOTES:**

# <span id="page-10-0"></span>**2.0 HARDWARE DESCRIPTION**

The MRF89XA is an integrated, single chip, low-power ISM band sub-GHz transceiver. A detailed block diagram of the MRF89XA is illustrated in [Figure 2-1](#page-11-0). The frequency synthesizer is clocked by an external 12.8 MHz crystal, and frequency ranges from 863-870 MHz, 902-928 MHz and 950-960 MHz are possible.

The MRF89XA receiver employs a superheterodyne architecture. The first IF is one-ninth of the RF frequency (approximately 100 MHz). The second down conversion, down converts the I and Q signals to baseband in the case of the FSK receiver (zero-IF) and to a low-IF (IF2) for the OOK receiver. After the second down-conversion stage, the received signal is channel select filtered and amplified to a level adequate for demodulation. Both FSK and OOK demodulation are available. Image rejection is achieved using a SAW filter.

The baseband I and Q signals at the transmitter side are digitally generated by a Direct Digital Synthesis (DDS) whose Digital-to-Analog Converters (DAC) are followed by two anti-aliasing low-pass filters that transform the digital signal into analog In-Phase (I) and Quadrature (Q) components with frequency as the selected Frequency Deviation (*fdev*). The transmitter supports both FSK and OOK modes of operation. The transmitter has a typical output power of +12.5 dBm. An internal transmit/receive switch combines the transmitter and receiver circuits into a single-ended RFIO pin (pin 31). The RFIO pin is connected through the impedance matching circuitry to an external antenna. The device operates in the low-voltage range of 2.1-3.6V, and in Sleep mode, it operates at a very low-current state, typically 0.1 µA.

The frequency synthesizer is based on an integer-N PLL having PLL bandwidth of 15 kHz. Two programmable frequency dividers in the feedback loop of the PLL and one programmable divider on the reference oscillator allow the LO frequency to be adjusted. The reference frequency is generated by a crystal oscillator running at 12.8 MHz.

The MRF89XA is controlled by a digital block that includes registers to store the configuration settings of the radio. These registers are accessed by a host microcontroller through a Serial Peripheral Interface (SPI). The quality of the data is validated using the RSSI and bit synchronizer blocks built into the transceiver. Data is buffered in a 64-byte transmitter or receiver FIFO. The transceiver is controlled through a 4-wire SPI, interrupts (IRQ0 and IRQ1), PLOCK, DATA and Chip Select pins for SPI are illustrated in

[Figure 2-1.](#page-11-0) On-chip regulators provide stable supply voltages to sensitive blocks and allow the MRF89XA to be used with supply voltages from 2.1-3.6V. Most blocks are supplied with a voltage below 1.4V.

The MRF89XA supports the following feature blocks:

- Data filtering and whitening
- Bit synchronization
- 64-byte transmit/receive FIFO buffer
- General configuration registers

These features reduce the processing load, which allows the use of simple, low-cost, 8-bit microcontrollers for data processing.

#### <span id="page-11-0"></span>**FIGURE 2-1: DETAILED BLOCK DIAGRAM OF THE MRF89XA**

# **TABLE 2-1: PIN DESCRIPTIONS**

# **2.1 Power Supply and Ground Block Pins**

To provide stable sensitivity and linearity characteristics over a wide supply range, the MRF89XA is internally voltage regulated. This internal regulated power supply block structure is illustrated in [Figure 2-2.](#page-13-0)

The power supply bypassing is essential for better handling of signal surges and noise in the power line. To ensure correct operation of the regulator circuit, the decoupling capacitor connection (shown in [Figure 2-2\)](#page-13-0) is recommended. These decoupling components are recommended for any design. The power supply block generates four regulated supplies for the analog, digital, VCO and the PLL blocks to reduce the voltages for their specific requirements. However, Power-on Reset (POR), Configuration registers and the SPI use the VDD supply given to the MRF89XA.

The large value decoupling capacitors should be placed at the PCB power input. The smaller value decoupling capacitors should be placed at every power point of the device and at bias points for the RF port. Poor bypassing can lead to conducted interference, which can cause noise and spurious signals to couple into the RF sections, thereby significantly reducing the performance.

It is recommended that the VDD pin have two bypass capacitors to ensure sufficient bypass and decoupling. However, based on the selected carrier frequency, the bypass capacitor values vary. The trace length (VDD pin to bypass capacitors) should be made as short as possible.

## <span id="page-13-0"></span>**FIGURE 2-2: POWER SUPPLY BLOCK DIAGRAM**

# **TABLE 2-2: POWER SUPPLY PIN DETAILS**

# **2.2 Reset Pin**

The device enters the Reset mode if any of the following events take place:

- Power-on Reset (POR)
- Manual Reset

The POR happens when the MRF89XA is switched on using VDD. The POR cycle takes at least 10 ms to execute any communication operations on the SPI bus.

An external hardware or manual Reset of the MRF89XA can be performed by asserting the TEST8 pin (pin 13) to high for 100 µs and then releasing the pin. After releasing the pin, it takes more than 5 ms for the transceiver to be ready for any operations. The pin is driven with an open-drain output, therefore, is pulled high while the device is in POR. The device will not accept commands during the Reset period. For more information, refer to [Section 3.1.2, Manual Reset.](#page-55-0)

# <span id="page-14-0"></span>**2.3 RFIO Pin**

The receiver and the transmitter share the same RFIO pin (pin 31). [Figure 2-3](#page-14-1) illustrates the configuration of the common RF front-end.

- In Transmit mode, the PA and the PA regulator are ON with voltage on the PARS pin (pin 29) equal to the nominal voltage of the regulator (about 1.8V). The external RF choke inductance is used to bias the PA.
- In Receive mode, the PA and PA regulator are OFF and PARS is tied to ground. The external RF choke inductor is used for biasing and matching the LNA (this is basically implemented as a common gate amplifier).

#### <span id="page-14-1"></span>**FIGURE 2-3: COMMON RF INPUT AND OUTPUT PIN DIAGRAM**

The PA and the LNA front-ends in the MRF89XA, which share the same Input/Output pin, are internally matched to approximately 50Ω.

# **2.4 Filters and Amplifiers Block**

## 2.4.1 INTERPOLATION FILTER

After digital-to-analog conversion during transmission, both I and Q signals are smoothed by interpolation filters. These low-pass filters the digitally generated signal, and prevents the alias signals from entering the modulators.

# 2.4.2 POWER AMPLIFIER

The Power Amplifier (PA) integrated in the MRF89XA operates under a regulated voltage supply of 1.8V. The external RF choke inductor is biased by an internal regulator output made available on the PARS pin (pin 29). Therefore, the PA output power is consistent over the power supply range. This is important for applications which allows both predictable RF performance and battery life.

An open collector output requires biasing using an inductor as an RF choke. For the recommended PA bias and matching circuit details see [Section 4.4.2,](#page-96-0) [Suggested PA Biasing And Matching.](#page-96-0)

The matching of the SAW filter depends on the SAW filter selected. Many modern SAW filters have 50Ω input and output, which simplifies matching for the MRF89XA. This is demonstrated in the application circuit. If the choice of SAW filter is different than 50 $\Omega$ , the required impedance match on the input and output of the SAW filter will be needed.

#### 2.4.3 LOW NOISE AMPLIFIER (WITH FIRST MIXER)

In Receive mode, the RFIO pin (pin 31) is connected to a fixed gain, common-gate, Low Noise Amplifier (LNA). The performance of this amplifier is such that the Noise Figure (NF) of the receiver is estimated to be approximately 7 dB.

The LNA has approximately  $50\Omega$  impedance, which functions well with the proposed antenna (PCB/ Monopole) during signal transmission. The LNA is followed by an internal RF band-pass filter.

### 2.4.4 IF GAIN AND SECOND I/Q MIXER

Following the LNA and first down-conversion, there is an IF amplifier whose gain can be programmed from 13.5-0 dB in 4.5 dB steps, through the register DMODREG. For more information, refer to [Section 2.14.2, DATA AND MODULATION](#page-30-0) [CONFIGURATION REGISTER DETAILS.](#page-30-0) The default setting corresponds to 0 dB gain, but lower values can be used to increase the RSSI dynamic range.

#### 2.4.5 CHANNEL FILTERS

The second mixer stages are followed by the channel select filters. The channel select filters have a strong influence on the noise bandwidth and selectivity of the receiver and therefore, its sensitivity. Each channel select filter features a passive second-order RC filter, with a programmable bandwidth and the "fine" channel selection is performed by an active, third-order, Butterworth filter, which acts as a low-pass filter for the zero-IF configuration (FSK), or a complex polyphase filter for the low-IF (OOK) configuration. For more information on configuring passive and active filters see [Section 3.4.4, Channel Filters](#page-61-0).

# **2.5 Frequency Synthesizer Block**

The frequency synthesizer of the MRF89XA is a fully integrated integer-N type PLL. The crystal oscillator provides the reference frequency for the PLL. The PLL circuit requires only a minimum of five external components for the PLL loop filter and the VCO tank circuit.

[Figure 2-4](#page-15-0) illustrates a block schematic of the MRF89XA PLL. Here the crystal reference frequency and the software controlled dividers R, P and S blocks determine the output frequency of the PLL.

The VCO tank inductors are connected on an external differential input. Similarly, the loop filter is also located externally.

<span id="page-15-0"></span>

#### 2.5.1 REFERENCE OSCILLATOR PINS (OSC1/OSC2)

The MRF89XA has an internal, integrated oscillator circuit and the OSC1 and OSC2 pins are used to connect to an external crystal resonator. The crystal oscillator provides the reference frequency for the PLL. The crystal oscillator circuit, with the required loading capacitors, provides a 12.8 MHz reference signal for the PLL. The PLL then generates the local oscillator frequency. It is possible to "pull" the crystal to the accurate frequency by changing the load capacitor value. The crystal oscillator load capacitance is typically 15 pF, which allows the crystal oscillator circuit to accept a wide range of crystals.

Choosing a higher tolerance crystal results in a lower TX to RX frequency offset and the ability to select a smaller deviation in baseband bandwidth. Therefore, the recommended crystal accuracy should be  $\leq 40$ ppm. The guidelines for selecting the appropriate crystal with specifications are explained in [Section 4.6,](#page-97-0) [Crystal Specification and Selection Guidelines](#page-97-0).

**Note:** Crystal frequency error will directly translate to carrier frequency  $(f_{rf})$ , bit rate and frequency deviation error.

# 2.5.2 CLKOUT OUTPUT PIN (CLKOUT)

The transceiver can provide a clock signal through the CLKOUT pin (pin 19) to the microcontroller for accurate timing, thereby eliminating the need for a second crystal. This results in reducing the component count. The CLKOUT is a sub-multiple of the reference frequency and is programmable.

The two main functions of the CLKOUT output are:

- To provide a clock output for a host microcontroller, thus saving the cost of an additional oscillator.
- To provide an oscillator reference output. Measurement of the CLKOUT signal enables simple software trimming of the initial crystal tolerance.

CLKOUT can be made available in any operation mode, except Sleep mode, and is automatically enabled at power-up.

#### 2.5.3 PHASE-LOCKED LOOP **ARCHITECTURE**

The Integer-N Phase-Locked Loop (PLL) circuitry determines the operating frequency of the device. The PLL maintains accuracy using the crystal-controlled reference oscillator and provides maximum flexibility in performance to the designers.

The high resolution of the PLL allows the use of multiple channels in any of the bands. The on-chip PLL is capable of performing manual and automatic calibration to compensate for the changes in temperature or operating voltage.

## 2.5.3.1 PLL Lock Pin (PLOCK)

The MRF89XA features a PLL lock (PLOCK) detect indicator. This is useful for optimizing power consumption, by adjusting the synthesizer wake-up time. The lock status can also be read on the LSTSPLL bit from the FTPRIREG register [\(Register 2-15](#page-39-0)), and must be cleared by writing a '1' to this same register. The lock status is available on the PLOCK pin (pin 23), by setting the LENPLL bit in the FTPRIREG register.

# 2.5.4 VOLTAGE CONTROLLED **OSCILLATOR**

The integrated Voltage Controlled Oscillator (VCO) requires two external tank circuit inductors. As the input is differential, the two inductors must have the same nominal value. The performance of these components are essential for both the phase noise and the power consumption of the PLL. It is recommended that a pair of high Q inductors is selected. These should be mounted orthogonally to other inductors in the circuit (in particular the PA choke) to reduce spurious coupling between the PA and VCO. For best performance, wire wound high-Q inductors with tight tolerance should be used as described in [Section 4.0, Application Details](#page-92-1). In addition, such measures may reduce radiated pulling effects and undesirable transient behavior, thus minimizing spectral occupancy.

**Note:** Ensuring a symmetrical layout of the VCO inductors will further improve PLL spectral purity.

The output signal of the VCO is used as the input to the local oscillator (LO) generator stage, as illustrated in [Figure 2-5.](#page-16-0)The VCO frequency is subdivided and used in a series of up/down conversions for transmission/ reception.

<span id="page-16-0"></span>**FIGURE 2-5: LO VCO OUTPUT GENERATOR**

# **2.6 MRF89XA Operating Modes (Includes Power-Saving Mode)**

This section summarizes the settings for each operating modes of the MRF89XA to save power that are based on the operations and available functionality. The timing requirements for switching between modes described in [Section 5.3, Switching Times and](#page-107-0) [Procedures.](#page-107-0)

## 2.6.1 MODES OF OPERATION

[Table 2-3](#page-17-1) lists the different operating modes of the MRF89XA, which can be used to save power.

#### 2.6.2 DIGITAL PIN CONFIGURATION VS. CHIP MODE

[Table 2-4](#page-17-0) lists the state of the digital I/Os in each of the above described modes of operation, regardless of the data operating mode (Continuous, Buffered, or Packet).

# <span id="page-17-1"></span>**TABLE 2-3: OPERATING MODES**

# <span id="page-17-0"></span>**TABLE 2-4: PIN CONFIGURATION VS. CHIP MODE**

**Note 1:** High-Z if Continuous mode is activated; otherwise, Output.

- **2:** Output if LENPLL = 1; otherwise, High-Z.
- **3:** Valid logic states must be applied to inputs at all times to avoid unwanted leakage currents. Suggestions for designers,
	- Use external pull down resistor.
	- Tristate the Microcontroller interrupt pin to output when setting the MRF89XA to sleep. Then reverse when waking it up. Since the Microcontroller is in control, this should be easy to do and not require an external pull down resistor.
- **4:** The SDO pin defaults to a high impedance (High-Z) state when any of the CS pins are high (the MRF89XA is not selected).

# **2.7 Interrupt (IRQ0 and IRQ1) Pins**

The Interrupt Requests (IRQ0 and IRQ1) pins 21 and 22, provide an interrupt signal to the host microcontroller from the MRF89XA. Interrupt requests are generated for the host microcontroller by pulling the IRQ0 (pin 21) or IRQ1 (pin 22) pins low or high based on the events and configuration settings of these interrupts. Interrupts must be enabled and unmasked before the IRQ pins are active. For detailed functional description of interrupts, see [Section 3.8, Data](#page-72-1) [Processing](#page-72-1) .

# **2.8 DATA Pin**

After OOK or FSK demodulation, the baseband signal is available to the user on the DATA pin (pin 20), when Continuous mode is selected. Therefore, in Continuous mode, the NRZ data to or from the modulator or demodulator respectively is directly accessed by the host microcontroller on the bidirectional DATA pin. The SPI Data, FIFO and packet handler are therefore inactive. In Buffered and Packet modes, the data is retrieved from the FIFO through the SPI.

During transmission, the DATA pin is configured as DATA (Data Out) and with internal Transmit mode disabled; this manually modulates the data from the external host microcontroller. If the Transmit mode is enabled, this pin can be tied "high" or can be left unconnected.

During reception, the DATA pin is configured as DATA (Data In); this pin receives the data in conjunction with DCLK. DATA pin (unused in packed mode) should be pulled-up to VDD through a 100 kΩ resistor.

# **2.9 Transmitter**

The transmitter chain is based on the same doubleconversion architecture and uses the same intermediate frequencies as the receiver chain. The main blocks include:

A digital waveform generator that provides the I and Q base-band signals. This block includes digital-toanalog converters and anti-aliasing low-pass filters.

A compound image-rejection mixer to up-convert the baseband signal to the first IF at one-ninth of the carrier frequency  $(f_{rf}$ , and a second image-rejection mixer to up-convert the IF signal to the RF frequency transmitter driver and power amplifier stages to drive the antenna port.

# <span id="page-18-0"></span>**FIGURE 2-6: TRANSMITTER ARCHITECTURE BLOCK DIAGRAM**

# 2.9.1 TRANSMITTER ARCHITECTURE

[Figure 2-6](#page-18-0) illustrates the transmitter architecture block diagram. The baseband I and Q signals are digitally generated by a DDS whose Digital-to-Analog Converters (DAC) followed by two anti-aliasing lowpass filters transform the digital signal into analog inphase (I) and quadrature (Q) components whose frequency is the selected frequency deviation, is set using the FDVAL<7:0> bits from FDEVREG<7:0>.

In FSK mode, the relative phase of I and Q is switched by the input data between -90° and +90° with continuous phase. The modulation is therefore performed at this initial stage, because the information contained in the phase difference will be converted into a frequency shift when the I and Q signals are up-converted in the first mixer stage. This first up-conversion stage is duplicated to enhance image rejection. The FSK convention is such that:

$$
DATA = 1 \rightarrow f_{rf} + f_{dev}
$$

$$
DATA = 0 \rightarrow f_{rf} - f_{dev}
$$

In OOK mode, the phase difference between the I and Q channels is kept constant (independent of the transmitted data). Thus, the first stage of up-conversion creates a fixed frequency signal at the low IF = *fdev* (this explains why the transmitted OOK spectrum is offset by *fdev*). OOK Modulation is accomplished by switching the PA and PA regulator stages ON and OFF. By convention:

$$
DATA = 1 \rightarrow PAon
$$

 $DATA = 0 \rightarrow PA$ off

After the interpolation filters, a set of four mixers combines the I and Q signals and converts them into a pair of complex signals at the second intermediate frequency, equal to one-eighth of the LO frequency, or one-ninth of the RF frequency. These two new I and Q signals are then combined and up-converted to the final RF frequency by two quadrature mixers fed by the LO signal. The signal is pre-amplified, and then the transmitter output is driven by a final power amplifier stage. The I and Q signal details are illustrated in [Figure 2-7.](#page-19-0)

<span id="page-19-0"></span>

# **2.10 Receiver**

The receiver is based on a superheterodyne architecture and comprises the following major blocks:

- An LNA that provides low-noise RF gain followed by an RF band-pass filter.
- A first mixer, which down-converts the RF signal to an intermediate frequency equal to one-ninth of the carrier frequency ( $f_{rf}$  100 MHz for 915 MHz signals).
- A variable gain first-IF preamplifier followed by two second mixers, which down-convert the first IF signal to I and Q signals at a low frequency (zero-IF for FSK, low-IF for OOK).
- A two-stage IF filter followed by an amplifier chain are available for both I and Q channels. Limiters at the end of each chain drive the I and Q inputs to the FSK demodulator function. An RSSI signal is also derived from the I and Q IF amplifiers to drive the OOK detector. The second filter stage in each channel can be configured as either a thirdorder Butterworth low-pass filter for FSK operation or an image reject polyphase band-pass filter for OOK operation.
- An FSK arctangent type demodulator driven from the I and Q limiter outputs, and an OOK demodulator driven by the RSSI signal. Either detector can drive a data and clock recovery function that provides matched filter enhancement of the demodulated data.

# 2.10.1 RECEIVER ARCHITECTURE

[Figure 2-8](#page-20-0) illustrates the receiver architecture block diagram. The first IF is one-ninth of the RF frequency (approximately 100 MHz). The second downconversion down-converts the I and Q signals to baseband in the case of the FSK receiver (zero-IF) and to a low-IF (IF2) for the OOK receiver.

After the second down-conversion stage, the received signal is channel-select filtered and amplified to a level adequate for demodulation. Both FSK and OOK demodulation are available. Finally, an optional bit synchronizer (BitSync) is provided to supply a synchronous clock and data stream to a companion microcontroller in Continuous mode, or to fill the FIFO buffers with glitch-free data in Buffered mode.

**Note:** Image rejection is achieved using a SAW filter on the RF input.

# <span id="page-20-0"></span>**FIGURE 2-8: RECEIVER ARCHITECTURE BLOCK DIAGRAM**

# **2.11 Serial Peripheral Interface (SPI)**

The MRF89XA communicates with the host microcontroller through a 4-wire SPI port as a slave device. An SPI-compatible serial interface allows the user to select, command and monitor the status of the MRF89XA through the host microcontroller. All the registers are addressed through the specific addresses to control, configure and read status bytes.

The SPI in the MRF89XA consists of the following two sub-blocks, as illustrated in [Figure 2-11](#page-22-0).

- SPI CONFIG: This sub-block is used in all data operation modes to read and write the configuration registers which control all the parameters of the chip (operating mode, frequency and bit rate).
- SPI DATA: This sub-block is used in Buffered and Packet mode to write and read data bytes to and from the FIFO. (FIFO Interrupts can be used to manage the FIFO content).

Both of these SPIs are configured in Slave mode while the host microcontroller is configured as the master. They have separate selection pins (CSCON and CSDAT) but share the remaining pins:

- SCK (SPI Clock): Clock signal provided by the host microcontroller
- SDI (SPI Input): Data Input signal provided by the host microcontroller
- SDO (SPI Output): Data Output signal provided by the MRF89XA

As listed in [Table 2-5,](#page-22-1) only one interface can be selected at a time with CSCON is having the priority:

#### <span id="page-22-1"></span>**TABLE 2-5: CONFIG VS. DATA SPI SELECTION**

All the parameters can be programmed and set through the SPI module. Any of these auxiliary functions can be disabled when it is not required. After power-on, all parameters are set to default values. The programmed values are retained during Sleep mode. The interface supports the read out of a status register, which provides detailed information about the status of the transceiver and the received data.

The MRF89XA supports SPI mode 0,0, which requires the SCK to remain idle in a low state. The CS pins, CSCON and CSDAT based on the mode (pin 14 and 15), must be held low to enable communication between the host microcontroller and the MRF89XA. The device's timing specification details are listed in [Table 5-7.](#page-106-0) The SDO pin defaults to a high impedance (hi-Z) state when any of the CS pins are high (the MRF89XA is not selected). This pin has a tri-state buffer and uses a bus hold logic.

As the device uses byte writes, any of the Chip Select (CS) pins should be pulled low for 8 bits. Data bits on the SDI pin (pin 17) are shifted into the device upon the rising edge of the clock on the SCK pin (pin 18) whenever the CS pins are low. The maximum clock frequency for the SPI clock for CONFIG mode is 6 MHz. However, maximum SPI Clock for DATA mode (to read/write FIFO) is 1 MHz. Data is received by the transceiver through the SDI pin and is clocked on the rising edge of SCK. The MRF89XA sends the data through the SDO pin and is clocked out on the falling edge of SCK. The Most Significant bit (MSb) is sent first in any data.

The SPI sequence diagrams are illustrated in [Figure 2-12](#page-23-0) through [Figure 2-15](#page-24-0).

#### <span id="page-22-0"></span>**FIGURE 2-11: SPI OVERVIEW AND HOST MICROCONTROLLER CONNECTIONS**

# 2.11.1 SPI CONFIG

**Write Register** - To write a value into a Configuration register, the timing diagram illustrated in [Figure 2-12](#page-23-0) should be followed by the host microcontroller. The new value of the register is effective from the rising edge of CSCON.

**Note:** When writing more than one register successively, it is not compulsory to toggle CSCON back high between two write sequences. The bytes are alternatively considered as address and value. In this instance, all new values will become effective on rising edge of CSCON.

<span id="page-23-0"></span>

**Read Register** - To read the value of a Configuration register, the timing diagram illustrated in [Figure 2-13](#page-23-1) should be followed by the host microcontroller.

**Note:** When reading more than one register successively, it is not compulsory to toggle CSCON back high between two read sequences. The bytes are alternatively considered as address and value.

<span id="page-23-1"></span>

# 2.11.2 SPI DATA

**Write Byte (before/during TX)** - To write bytes into the FIFO, the timing diagram illustrated in [Figure 2-14](#page-24-1) should be followed by the host microcontroller.

**Note:** It is compulsory to toggle CSDAT back high between each byte written. The byte is pushed into the FIFO on the rising edge of CSDAT.

<span id="page-24-1"></span>

**Read Byte (after/during RX)** - To read bytes from the FIFO, the timing diagram illustrated in [Figure 2-15](#page-24-0) should be followed by the host microcontroller.

**Note:** It is recommended to toggle CSDAT back high between each byte read.

<span id="page-24-0"></span>

# **2.12 FIFO and Shift Register (SR)**

In Buffered and Packet modes of operation, data to be transmitted and data that has been received are stored in a configurable First In First Out (FIFO) buffer. The FIFO is accessed through the SPI data interface and provides several interrupts for transfer management.

The FIFO is 1 byte (8 bits) wide; therefore, it only performs byte (parallel) operations, whereas the demodulator functions serially. A shift register (SR) is therefore employed to interface the demodulator and the FIFO. In Transmit mode it takes bytes from the FIFO and outputs them serially (MSB first) at the programmed bit rate to the modulator. Similarly, in Receive mode the shift register gets bit-by-bit data from the demodulator and writes them byte-by-byte to the FIFO. This is illustrated in [Figure 2-16.](#page-25-1)

#### <span id="page-25-1"></span>**FIGURE 2-16: FIFO AND SHIFT REGISTER**

#### <span id="page-25-0"></span>**FIGURE 2-17: MRF89XA MEMORY SPACE**

# Control Registers Transmit/Receive FIFO 0x00 0x00 0x1F 64 bytes 0x40 SHIFT REGISTER (8 bits) <sup>1</sup> Data TX/RX MSB

# **2.13 MRF89XA Configuration, Control and Status Registers**

The memory in the MRF89XA transceiver is implemented as static RAM and is accessible through the SPI port. The memory configuration of the MRF89XA is illustrated in [Figure 2-17](#page-25-0) and [Figure 2-18](#page-26-0).

<span id="page-26-0"></span>**FIGURE 2-18: MRF89XA REGISTERS MEMORY MAP**

The MRF89XA registers functionally handles command, configuration, control, status or data/FIFO fields as listed in [Table 2-6.](#page-27-0) The registers operate on parameters common to transmit and receive modes, Interrupts, Sync pattern, crystal oscillator and packets.

The FIFO serves as a buffer for data transmission and reception. There is a shifted register (SR) to handle bit shifts for the FIFO during transmission and reception. POR sets default values in all Configuration/Control/ Status registers.

#### 2.14.3 FREQUENCY DEVIATION CONTROL REGISTER DETAILS

#### **REGISTER 2-3: FDEVREG: FREQUENCY DEVIATION CONTROL REGISTER (ADDRESS:0X02) (POR:0X03)**

bit 7-0 **FDVAL<7:0>:** Frequency Deviation Value bits

The bits indicate single side frequency deviation (in bit value) in FSK Transmit mode. FDVAL = 00000011 ≥ *fdev* = 100 kHz (default)

$$
f_{dev} = \frac{f_{xtal}}{(32 \times (FDVAL + 1))}
$$

Where,

FDVAL is the value in the register and has the range from 0 ≤ FDVAL ≤ 255. Refer to [Section 3.3.3,](#page-58-0)  [fdev Setting in FSK Mode](#page-58-0) and [Section 3.3.4, fdev Setting in OOK Mode](#page-58-1) for more information on the *fdev* setting for FSK and OOK modes.

**Note 1:**  $f_{dev}$  is used through out the data sheet to understand the term frequency deviation and is calculated using FDVAL<7:0> from FDEVREG.

#### 2.14.4 BIT RATE SET REGISTER DETAILS

#### **REGISTER 2-4: BRSREG: BIT RATE SET REGISTER (ADDRESS:0x03) (POR:0x07)**

bit 7 **Reserved:** Reserved bit; do not use

0 = Reserved (default)

bit 6-0 **BRVAL<6:0>:** Bit Rate Value bits These bits set the bit rate (in bit value) of:

$$
BitRate = \frac{f_{xtal}}{(64(BRVAL + 1))}
$$

BRVAL<6:0> =  $0000111 \geq B$ it Rate = 25 kbps NRZ (default)

Where, BRVAL is the value in the register and has the range from  $0 \leq BRYAL \leq 127$ 

**Note 1:** The Bit Rates are good for crystal frequency of 12.8 MHz which is taken as reference throughout the data sheet.

## 2.14.5 FLOOR THRESHOLD CONTROL REGISTER DETAILS

#### **REGISTER 2-5: FLTHREG: FLOOR THRESHOLD CONTROL REGISTER (ADDRESS:0x04) (POR:0x0C)**

 $\vert r$  = Reserved

bit 7-0 **FTOVAL<7:0>:** Floor Threshold OOK Value bits The bits indicate Floor threshold in OOK receive mode. FTOVAL<7:0> =  $00001100 \ge 6$  dB (default) FTOVAL assumes 0.5 dB RSSI Step

#### 2.14.6 FIFO CONFIGURATION REGISTER DETAILS

## **REGISTER 2-6: FIFOCREG: FIFO CONFIGURATION REGISTER (ADDRESS:0x05) (POR:0x0F)**

FIFO\_THRESHOLD interrupt source's behavior depends on the running mode (TX, RX or Stand-by mode).

#### 2.14.7 R1 COUNTER SET REGISTER DETAILS

#### **REGISTER 2-7: R1CREG: R1 COUNTER SET REGISTER (ADDRESS:0x06) (POR:0x77)**

#### bit 7-0 **R1CVAL<7:0>:** R1 Value bits

These bits indicate the value in R1 counter to generate carrier frequencies in FSK mode. R1CVAL<7:0> = 0x77 (default)

R1CVAL is activated if RPS = 0 in GCONREG. Also, default values R1, P1 and S1 generate 915 MHz in FSK Mode.

#### 2.14.8 P1 COUNTER SET REGISTER DETAILS

#### **REGISTER 2-8: P1CREG: P1 COUNTER SET REGISTER (ADDRESS:0x07) (POR:0x64)**

#### bit 7-0 **P1CVAL<7:0>:** P1 Value bits

These bits indicate the value in P1 counter to generate carrier frequencies in FSK mode. P1CVAL<7:0> = 0x64 (default)

P1CVAL is activated if RPS = 0 in GCONREG. Also default values R1, P1 and S1 generate 915 MHz in FSK Mode.

#### 2.14.9 S1 COUNTER SET REGISTER **DETAILS**

#### **REGISTER 2-9: S1CREG: S1 COUNTER SET REGISTER (ADDRESS:0x08) (POR:0x32)**

#### bit 7-0 **S1CVAL<7:0>:** S1 Value bits

These bits indicate the value in S1 counter to generate carrier frequencies in FSK mode. S1CVAL<7:0> = 0x32 (default)

S1CVAL is activated if RPS = 0 in GCONREG. Also default values R1, P1 and S1 generate 915 MHz in FSK Mode.

#### <span id="page-37-0"></span>**REGISTER 2-14: FTXRXIREG: FIFO TRANSMIT AND RECEIVE INTERRUPT REQUEST CONFIGURATION REGISTER (ADDRESS:0x0D) (POR:0x00)**

#### bit 7-6 **IRQ0RXS<1:0>:** IRQ0 Receive Stand-by bits

These bits control the IRQ0 source in Receive and Stand-by modes:

```
If DMODE1:DMODE0 = 00 \rightarrow Continuous Mode (default)
             11 = SYNC10 = SYNC 
             01 = RSSI
             00 = Sync (default)
             If DMODE1:DMODE0 = 01 \rightarrow Buffer Mode
             11 = SYNC10 = FIFOEMPTY(1)
             01 = WRITEBYTE
             00 = - (default)If DMODE1:DMODE0 = 1x \rightarrow P Packet Mode
             11 = SYNC or ARDSMATCH(3) (if address filtering is enabled)
             10 = FIFOEMPTY(1)
             01 = WRITEBYTE
             00 = PLREADY(2) (default)
bit 5-4 IRQ1RXS<1:0>: IRQ1 Receive Stand-by bits 
             These bits control the IRQ1 source in Receive and Stand-by modes: 
             If DMODE1:DMODE0 = 00 \rightarrow Continuous Mode (default)
             xx = DCLKIf DMODE1:DMODE0 = 01 \rightarrow Buffer Mode
             11 = FIFO_THRESHOLD(1)
             10 = RSSI
             01 = FIFOFULL(1)
             00 = - (default)
             If DMODE1:DMODE0 = 1x \rightarrow P Packet Mode
             11 = FIFO_THRESHOLD(1)
             10 = RSSI
             01 = FIFOFULL(1)
             00 = CRCOK (default)
 Note 1: This mode is also available in Stand-by mode.
       2: PLREADY = Payload ready
```

```
3: ADRSMATCH = Address Match
```

# **3.0 FUNCTIONAL DESCRIPTION**

The functional block diagram of the MRF89XA is illustrated in [Figure 3-1.](#page-54-0) The functional operations of individual blocks are explained in subsequent sections.

<span id="page-54-0"></span>

## **3.1 Reset of the Chip**

A power-on Reset of the MRF89XA is triggered at power up. Additionally, a manual reset can be issued by controlling the TEST8 pin (pin 13).

#### 3.1.1 POWER-ON RESET (POR)

If the application requires the disconnection of VDD from the MRF89XA, the user should wait for 10 ms from the end of the POR cycle before commencing communications using SPI. The TEST8 pin should be left floating during the POR sequence. [Figure 3-2](#page-55-0) illustrates the POR Timing.

**Note:** Any CLKOUT-related activity can also be used to detect that the chip is ready.

## 3.1.2 MANUAL RESET

A manual reset of the MRF89XA is possible even for applications in which VDD cannot be physically disconnected. The TEST8 pin should be pulled high for 100 µs and then released. The user should then wait 5 ms before using the chip. The pin is driven with an open-drain output, and therefore, is pulled high while the device is in POR. [Figure 3-3](#page-55-1) illustrates the Manual Reset Timing

**Note:** When the TEST8 pin is driven high, an current consumption of up to 10 mA can be seen on VDD.

## <span id="page-55-0"></span>**FIGURE 3-2: POR TIMING DIAGRAM**

## <span id="page-55-1"></span>**FIGURE 3-3: MANUAL RESET TIMING DIAGRAM**

## **3.2 Frequency Synthesis Description**

## 3.2.1 REFERENCE OSCILLATOR

The crystal oscillator (XTAL) forms the reference oscillator of an Integer-N PLL. The crystal reference frequency and the software controlled dividers R, P, and S determine the output frequency of the PLL. The guidelines for selecting the appropriate crystal with specifications are explained in [Section 4.6, Crystal](#page-97-0) [Specification and Selection Guidelines](#page-97-0).

**Note:** Use the recommended values provided in the Bill Of Materials (BOM) in [Section 4.7,](#page-98-0) [Bill of Materials](#page-98-0) for any PLL prototype design.

## 3.2.2 BUFFERED CLOCK OUTPUT

The buffered clock output is a signal derived from *fxtal*. It can be used as a reference clock (or a sub-multiple of it) for the host microcontroller and is an output on the CLKOUT pin (pin 19). The pin is activated using the CLKOCNTRL bit (CLKOUTREG<7>). The output frequency (CLKOUT) division ratio is programmed through the Clock Out Frequency bits (CLKOFREQ5- CLK0FREQ1) in the Clock Output Control Register (CLKOUTREG<6:2>). The two uses of the CLKOUT output are:

- To provide a clock output for a host microcontroller, thus saving the cost of an additional oscillator. CLKOUT can be made available in any operation mode, except Sleep mode, and is automatically enabled at power-up.
- To provide an oscillator reference output. Measurement of the CLKOUT signal enables simple software trimming of the initial crystal tolerance.

**Note:** CLKOUT is disabled when the MRF89XA is in Sleep mode. If Sleep mode is used, the host microcontroller must have provi-

## 3.2.3 CLOCK REGISTERS

The registers associated with the Clock and its control are:

- GCONREG ([Register 2-1](#page-29-0))
- CLKOUTREG [\(Register 2-28\)](#page-49-0).

## 3.2.4 PHASE-LOCKED LOOP (PLL)

The frequency synthesizer of the MRF89XA is a fully integrated integer-N type PLL. The PLL circuit requires only five external components for the PLL loop filter and the VCO tank circuit.

#### 3.2.4.1 PLL Requirements

With integer-N PLL architecture, the following conditions must be met to ensure correct operation:

• The comparison frequency, FCOMP, of the Phase Frequency Detector (PFD) input must remain higher than six times the PLL bandwidth (PLLBW) to guarantee loop stability and to reject harmonics of the comparison frequency FCOMP. This is expressed in the inequality:

FCOMP ≥ 6 \* PLLBW

- However the PLLBW must be sufficiently high to allow adequate PLL lock times.
- Because the divider ratio R determines FCOMP, it should be set close to 119, leading to  $F_{\text{COMP}} \approx 100$  kHz, which will ensure suitable PLL stability and speed.

The following criteria govern the R, P, and S values for the PLL block:

- 64  $\leq$  R  $\leq$  169
- $P+1 > S$
- PLLBW = 15 kHz nominal
- Start-up times and reference frequency drives as specified

#### 3.2.4.2 PLL Lock Detection Indicator

The MRF89XA features a PLL lock detect indicator. This is useful for optimizing power consumption, by adjusting the frequency synthesizer wake-up time (TSFS). For more information on TSFS, refer [Table 5-4.](#page-104-0) The lock status is available by reading the Lock Status of PLL bit (LSTSPLL) in the FIFO Transmit PLL and RSSI Interrupt Request Configuration register (FTPRIREG<1>), and must be cleared by writing a '1' to this same register. The lock status can also be seen on the PLOCK pin (pin 23) of the device, by setting the LENPLL bit (FTPRIREG<0>).

sions to run from its own clock source.<br>
Note: The LSTSPLL bit latches high each time the PLL locks and must be reset by writing a '1' to LSTSPLL from FTPRIREG.

## 3.2.5 PLL REGISTERS

The registers associated with the PLL are:

- GCONREG ([Register 2-1](#page-29-0))
- FTPRIREG ([Register 2-15](#page-39-0)).

## 3.2.6 SW SETTINGS OF THE VCO

To guarantee the optimum operation of the VCO over the MRF89XA's frequency and temperature ranges, the settings listed in [Table 3-1](#page-57-0) should be programmed into the MRF89XA.

<span id="page-57-0"></span>

#### 3.2.6.1 Trimming the VCO Tank by Hardware and Software

To ensure that the frequency band of operation may be accurately addressed by the R, P, and S dividers of the synthesizer, it is necessary to ensure that the VCO is correctly centered. The MRF89XA built-in VCO trimming feature makes it easy and is controlled by the SPI interface. This tuning does not require any RF test equipment, and can be achieved by measuring Vtune, the voltage between the PLLN and PLLP pins (6 and 7 pins).

The VCO is centered if the voltage is within the range of  $50 \leq$  Vtune(mV)  $\leq$  150.

This measurement should be conducted when in Transmit mode at the center frequency (fo) of the desired band (for example, approximately 867 MHz in the 863-870 MHz band), with the appropriate frequency band setting using the (FBS<1:0> bits (GCONREG<4:3>).

If this inequality is not satisfied, adjust the VCOT<1:0> bits (GCONREG<2:0>) from '00' by monitoring Vtune. This allows the VCO voltage to be trimmed in +60 mV increments. If the desired voltage range is inaccessible, the voltage may be adjusted further by changing the tank circuit inductance value.

An increase in inductance results in an increase Vtune. In addition, for mass production, the VCO capacitance is piece-to-piece dependant. As such, the optimization proposed above should be verified on several prototypes, to ensure that the population is centered with 100 mV.

The register associated with VCO is:

• GCONREG ([Register 2-1](#page-29-0)).

## <span id="page-57-4"></span>3.2.7 FREQUENCY CALCULATION

As illustrated in [Figure 2-5,](#page-16-0) the PLL structure comprises three different dividers, R, P, and S, which set the output frequency through the LO. A second set of dividers is also available to allow rapid switching between a pair of frequencies: R1/P1/S1 and R2/P2/ S2. These six dividers are programmed by six independent registers (see [Register 2-7](#page-33-0) through [Register 2-](#page-35-0) [12\)](#page-35-0), which are selected by GCONREG.

## **FSK Mode**

The formula provided in [Equation 3-1](#page-57-1) gives the relationship between the local oscillator, and R, P and S values, when using FSK modulation.

### <span id="page-57-1"></span>**EQUATION 3-1:**

$$
f_{rf,fsk} = \frac{9}{8}f_{lo}
$$

$$
f_{rf,fsk} = \frac{9}{8} \times \frac{f_{xtal}}{R+1} [75*(P+1) + S]
$$

## 3.2.8 FSK MODE REGISTERS

The registers associated with FSK mode are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0).

## **OOK Mode**

Due to the manner in which the baseband OOK symbols are generated, the signal is always offset by the FSK frequency deviation (FDVAL<7:0> as programmed in FDEVREG<7:0>). Therefore, the center of the transmitted OOK signal is represented by [Equation 3-2.](#page-57-2)

#### <span id="page-57-2"></span>**EQUATION 3-2:**

$$
f_{rf, ook, tx} = \frac{9}{8} \times f_{lo} - f_{dev}
$$

$$
f_{rf, ook, tx} = \frac{9}{8} \times \frac{f_{xtal}}{R+1} [75*(P+1) + S] - f_{dev}
$$

Consequently, in Receive mode, due to the low intermediate frequency (Low-IF) architecture of the MRF89XA, the frequency should be configured so as to ensure the correct low-IF receiver baseband center frequency, IF2, as shown in [Equation 3-3](#page-57-3).

## <span id="page-57-3"></span>**EQUATION 3-3:**

$$
f_{rf, ook, rx} = \frac{9}{8} \times f_{lo} - IF2
$$

$$
f_{rf, ook, rx} = \frac{9}{8} \times \frac{f_{xtal}}{R+1} [75*(P+1) + S] - IF2
$$

As described in [Section 3.4.4, Channel Filters,](#page-61-0) it is recommended that IF2 be set to 100 kHz.

## 3.2.9 OOK MODE REGISTERS

The registers associated with OOK mode are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FLTHREG [\(Register 2-5](#page-32-0))
- OOKCREG [\(Register 2-22\)](#page-45-1)

## **3.3 Transmitter**

The MRF89XA is set to Transmit mode when the CMOD<2:0> bits (GCONREG<7:5>) are set to '100' (see [Register 2-1\)](#page-29-0).

The transmitter chain in the MRF89XA is based on the same double-conversion architecture and uses the same intermediate frequencies as the receiver chain.

## 3.3.1 BIT RATE SETTING

In Continuous Transmit mode, setting the bit rate through the BRVAL<6:0> bits (BRSREG<6:0>) is useful to determine the frequency of DCLK. As explained in [Section 3.9.1, TX Processing,](#page-73-0) DCLK will trigger an interrupt on the host microcontroller each time a new bit has to be transmitted, as shown in [Equation 3-4.](#page-58-0)

#### <span id="page-58-0"></span>**EQUATION 3-4:**

$$
BR = \frac{f_{xtal}}{64* [1 + val(BRVAL < 6:0>)]}
$$

## 3.3.2 ALTERNATIVE SETTINGS

Bit rate, frequency deviation, and TX interpolation filter settings are a function of the crystal frequency (*fxtal*) of the reference oscillator. Settings other than those programmed with a 12.8 MHz crystal can be obtained by selecting the correct reference oscillator frequency.

## 3.3.3 *fdev* SETTING IN FSK MODE

The frequency deviation, *f<sub>dev*</sub>, of the FSK transmitter is<br>programmed through the FDVAL<7:0> bits through the FDVAL $\le$ 7:0> (FDEVREG<7:0>), as shown in [Equation 3-5.](#page-58-1)

## <span id="page-58-1"></span>**EQUATION 3-5:**

$$
f_{dev} = \frac{f_{xtal}}{32*[1 + val(FDVAL<7:0>)]}
$$

For correct operation, the modulation index  $\beta$  should be equal to [Equation 3-6.](#page-58-2)

## <span id="page-58-2"></span>**EQUATION 3-6:**

$$
\beta = \frac{2^* f_{dev}}{BRVAL} \ge 2
$$

For communication between a pair of MRF89XAs the *fdev* should be at least 33 kHz to ensure a correct operation on the receiver side.

## 3.3.4 *fdev* SETTING IN OOK MODE

*fdev* has no physical meaning in OOK Transmit mode. However, due to the DDS baseband signal generation, the OOK signal is always offset by "-*fdev*" (see [Section 3.2.7, Frequency Calculation\)](#page-57-4). It is suggested that *fdev* retains its default value of 100 kHz in OOK mode.

#### 3.3.5 INTERPOLATION FILTER

After digital-to-analog conversion, the I and Q signals are smoothened by interpolation filters. Low-pass filters in this block digitally generates the signal and prevent the alias signals from entering the modulators. Its bandwidth can be programmed with the (TXIPOLFV<6:0> bits (TXPARCREG>7:1), and should be calculated as shown in [Equation 3-7.](#page-58-3)

#### <span id="page-58-3"></span>**EQUATION 3-7:**

$$
BW \cong 3^* \bigg[ f_{dev} + \frac{BR}{2} \bigg]
$$

Where,

*fdev* is the programmed frequency deviation as set in FDEVREG

*BR* is the physical bit rate of transmission

**Note:** Low interpolation filter bandwidth will attenuate the baseband I/Q signals, thus reducing the power of the FSK signal. Conversely, excessive bandwidth will degrade spectral purity.

For most of the applications a BW of around 125 KHz would be acceptable, but for wideband FSK modulation, the recommended filter setting cannot be reached. However, the impact on spectral purity will be negligible due to the existing wideband channel.

## 3.3.6 POWER AMPLIFIER

#### 3.3.6.1 Rise and Fall Time Control

In OOK mode, the PA ramp times can be accurately controlled through the PARC<1:0> bits (PACONREG<4:3>). These bits directly control the slew rate of the PARS pin.

## 3.3.7 TRANSMIT MODE REGISTERS

The registers associated with Transmit mode are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG ([Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4\)](#page-31-1)
- R1CREG ([Register 2-7\)](#page-33-0)
- P1CREG [\(Register 2-8\)](#page-33-1)
- S1CREG [\(Register 2-9\)](#page-34-0)
- R2CREG ([Register 2-10](#page-34-1))
- P2CREG [\(Register 2-11](#page-35-1))
- S2CREG [\(Register 2-12](#page-35-0))
- PACREG [\(Register 2-13](#page-36-0))
- FTXRXIREG ([Register 2-14](#page-37-0))
- FTPRIREG ([Register 2-15](#page-39-0))

During the Transmit mode of MRF89XA, the Shift register takes bytes from the FIFO and outputs them serially (MSb first) at the programmed bit rate to the modulator. When the transmitter is enabled, it starts sending out data from the Shift register with respect to the set bit rate. After power-up and with the Transmit registers enabled, the transmitter preloads the FIFO with preambles before sending the actual data based on the mode of operation. [Figure 3-4](#page-59-0) illustrates the PA Control Timing.

## <span id="page-59-0"></span>**FIGURE 3-4: PA TIMING CONTROL**

## **3.4 Receiver**

The MRF89XA is set to Receive mode when the CMOD<2:0> bits (GCONREG<7:5>) are set to '011' (see [Register 2-1\)](#page-29-0).

The receiver is based on the superheterodyne architecture. (In super heterodyne architecture you need to use a saw filter to give better image rejection). The front-end is composed of an LNA and a mixer whose gains are constant. The mixer down-converts the RF signal to an intermediate frequency, which is equal to one-eighth of the LO frequency, which in turn is equal to eight-ninths of the RF frequency. Behind this first mixer there is a variable gain IF amplifier that can be programmed from maximum gain of 13.5-0 dB in steps of 4.5 dB by altering the IFGAIN<1:0> bits (DMODREG<1:0>).

After the variable gain IF amplifier, the signal is downconverted into two I and Q base-band signals by two quadrature mixers that are fed by reference signals at one-eighth the LO frequency. These I and Q signals are then filtered and amplified before demodulation.

The first filter is a second-order passive R-C filter whose bandwidth can be programmed to 16 values with the PASFILV<3:0> bits (FILCREG<7:4>). The second filter can be configured as either a third-order Butterworth active filter, which acts as a low-pass filter for the zero-IF FSK configuration, or as a polyphase band-pass filter for the low-IF OOK configuration. To select Butterworth low-pass filter operation, the POLFILEN bit (SYNCREG<7>) is set to '0'. The bandwidth of the Butterworth filter can be programmed to 16 values by configuring the BUTFILV<3:0> bits (FILCREG<3:0>). The low-IF configuration must be used for OOK modulation. This configuration is enabled when the POLFILEN bit (SYNCREG<7>) is set to '1'. The center frequency (fo) of the polyphase filter can be programmed to 16 values by setting the POLCFV<3:0> bits (PFCREG<7:4>). The bandwidth of the filter can be programmed by configuring the BUTFILV<3:0> bits (FILCREG<3:0>). In OOK mode, the value of the low-IF is equal to the deviation frequency defined in FDEVREG.

In addition to the channel filtering, the function of the polyphase filter is to reject the image. [Figure 3-5](#page-60-0) illustrates the two configurations of the second IF filter. In the Butterworth configuration, FCBW is the 3 dB cutoff frequency. In the polyphase band-pass configuration, FOPP is the center frequency given by the POLCFV<3:0> bits (PFCREG<7:4>), and FCPP is the upper 3 dB bandwidth of the filter whose offset, referenced to FOPP, is given by BUTFILV<3:0> bits (FILCREG<3:0>).

3.4.1 MRF89XA SECOND IF FILTER DETAILS

<span id="page-60-0"></span>

After filtering, the I and Q signals are each amplified by a chain of 11 amplifiers having 6 dB of gain each. The outputs of these amplifiers and their intermediate 3 dB nodes are used to evaluate the received signal strength (RSSI). Limiters are located behind the 11 amplifiers of the I and Q chains and the signals at the output of these limiters are used by the FSK demodulator. The RSSI output is used by the OOK demodulator. The global bandwidth of the entire base-band chain is given by the bandwidths of the passive filter, the Butterworth filter, the amplifier chain, and the limiter. The maximum achievable global bandwidth when the bandwidths of the first three blocks are programmed at their upper limit is approximately 350 kHz.

#### 3.4.2 LNA AND FIRST MIXER

In Receive mode, the RFIO pin is connected to a fixed gain, common-gate, Low Noise Amplifier (LNA). The performance of this amplifier is such that the Noise Figure (NF) of the receiver is estimated to be approximately 7 dB.

## 3.4.3 IF GAIN AND SECOND I/Q MIXER

Following the LNA and first down-conversion, there is an IF amplifier whose gain can be programmed from - 13.5-0 dB in 4.5 dB steps, through the IFGAIN<1:0><br>bits (DMODREG<1:0>). The default setting bits (DMODREG<1:0>). The default setting corresponds to 0 dB gain, but lower values can be used to increase the RSSI dynamic range. For more information, refer [Section 3.4.7, received signal](#page-63-0) [strength \(RSSI\).](#page-63-0)

#### <span id="page-61-0"></span>3.4.4 CHANNEL FILTERS

The second mixer stages are followed by the channel select filters. The channel select filters have a strong influence on the noise bandwidth and selectivity of the receiver and hence its sensitivity. Each filter comprises a passive and an active section.

#### 3.4.4.1 Passive Filter

Each channel select filter features a passive secondorder RC filter, with a bandwidth programmable through the PASFILV<3:0> bits (FILCREG<7:4). As the wider of the two filters, its effect on the sensitivity is negligible, but its bandwidth must be set up to optimize blocking immunity. The value entered into this register sets the single side bandwidth of this filter. For optimum performance it should be set to three to four times the cut-off frequency (fc) of the active Butterworth (or Polyphase) filter described in [Section 3.4.4.2, Active](#page-61-2) [Filter,](#page-61-2) and as shown in [Equation 3-8.](#page-61-5)

<span id="page-61-1"></span>**FIGURE 3-6: ACTIVE CHANNEL FILTER DESCRIPTION**

<span id="page-61-5"></span>

$$
3 * f_{c}_\mathit{ButterFilter} \leq BW_{passive, filter} \leq 4 * f_{c}_\mathit{ButterFilter}
$$

#### <span id="page-61-2"></span>3.4.4.2 Active Filter

The "fine" channel selection is performed by an active, third-order, Butterworth filter, which acts as a low-pass filter for the zero-IF configuration (FSK), or a complex Polyphase filter for the low-IF (OOK) configuration. The POLFILEN bit (SYNCREG<7>) enables or disables the Polyphase filter.

[Figure 3-6](#page-61-1) illustrates the required bandwidth of this filter that varies between the two demodulation modes.

**FSK mode**: The 99% energy bandwidth of an FSK modulated signal is approximated, as shown in

#### <span id="page-61-3"></span>**EQUATION 3-9:**

[Equation 3-9.](#page-61-3)

$$
BW_{99\%,fsk} = 2 \cdot \left[ f_{dev} + \frac{BR}{2} \right]
$$

The BUTFILV<3:0> bits from FILCREG set co the cutoff frequency (*f<sup>c</sup>* ) of the filter. In a zero-IF configuration, the FSK lobes are centered on the virtual "DC" frequency. The choice of *co* should be such that the modulated signal falls in the filter bandwidth, anticipating the Local Oscillator frequency drift over the operating temperature and aging of the device as shown in:[Equation 3-10](#page-61-6)

#### <span id="page-61-6"></span>**EQUATION 3-10:**

$$
2*f_c > BW_{99\%,fsk} + LO_{drifts}
$$

[Figure 3-11](#page-65-0) illustrates an accurate overview of the filter bandwidth vs. setting.

**OOK mode**: The 99% energy bandwidth of an OOK modulated signal is approximated, as shown in [Equation 3-11.](#page-61-4)

#### <span id="page-61-4"></span>**EQUATION 3-11:**

$$
BW_{99\%,ook} = \frac{2}{t_{bit}} = 2*BR
$$

The POLCFV<3:0> bits (PFCREG<7:4>) set *f<sup>o</sup>* , the center frequency of the polyphase filter when activated. *fo* should always be chosen to be equal to the low Intermediate Frequency of the receiver (IF2). Because low IF frequency of the OOK receiver denoted by IF2 can always be replaced by *f<sup>o</sup>* for any calculations or monitoring purposes.

The following setting is recommended:

 $f_o$  = 100 kHz POLCFV<3:0> = 0011.

The value stored as BUTFILV<3:0> bits  $(FILCREG < 3:0)$  determines  $f_c$ , the filter cut-off frequency. Therefore,  $f_c$  should be set according to [Equation 3-12.](#page-62-1)

## <span id="page-62-1"></span>**EQUATION 3-12:**

 $2*(f_c - f_o) > BW_{99\%, ook} + LO_{drifts}$ 

Where,

*fc* is the cut-off frequency *fo* is the center frequency

Again, *f<sup>c</sup>* as a function of the BUTFILV<3:0> bits, is described in [Section 3.4.6, Channel Filters Setting in](#page-63-1) [OOK Mode.](#page-63-1)

#### 3.4.5 CHANNEL FILTERS SETTING IN FSK MODE

*fc* , the 3dB cut-off frequency of the Butterworth filter used in FSK reception, is programmed through the BUTFILV<3:0> bits (FILCREG<3:0>). However, the entire receiver chain influences this cut-off frequency. The channel select and resultant filter bandwidths are illustrated in [Figure 3-7.](#page-62-0)

[Table 4-2](#page-97-1) suggests filter settings in FSK mode along with the corresponding passive filter bandwidth and the accepted tolerance on the crystal reference.

## <span id="page-62-0"></span>**FIGURE 3-7: ACTUAL BW OF BUTTERWORTH FILTER**

#### <span id="page-63-1"></span>3.4.6 CHANNEL FILTERS SETTING IN OOK MODE

The center frequency,  $f_o$ , is always set to 100 kHz. The chart in [Figure 3-8](#page-63-2) illustrates the receiver bandwidth when the BUTFILV<3:0> bits (FILCREG<3:0>) are changed when the polyphase filter is activated.

[Table 4-2](#page-97-1) suggests a few filter settings in OOK mode along with the corresponding passive filter bandwidth and the accepted tolerance on the crystal reference.

#### <span id="page-63-0"></span>3.4.7 RECEIVED SIGNAL STRENGTH (RSSI)

After filtering, the In-phase and Quadrature signals are amplified by a chain of 11 amplifiers, each with 6dB gain. The outputs of these amplifiers are used to evaluate the RSSI.

### 3.4.7.1 Resolution and Accuracy

When the RSSI resolution is 0.5 dB, the absolute accuracy is not expected to be better than ±3dB due to process and external component variation. Higher accuracy while performing absolute RSSI measurements will require additional calibration.

## <span id="page-63-2"></span>**FIGURE 3-8: ACTUAL BW OF POLYPHASE FILTER**

## 3.4.7.2 Acquisition Time

In OOK mode, the RSSI evaluates the signal strength by sampling I(t) and Q(t) signals 16 times in each period of the chosen IF2 frequency (refer to [Section 2.10.1, Receiver Architecture\)](#page-20-0). In FSK mode, the signals are sampled 16 times in each *fdev* period, *fdev* being the frequency deviation of the companion transmitter. An average is then performed over a sliding window of 16 samples. Therefore, the RSSI output register RSTSREG (RSSIVAL<7:0>) is updated 16 times in each *fdev* or IF2 period.

The following settings are recommended:

- FSK Mode: Ensure that the *fdev* parameter (as described in the FDEVREG register ([Register 2-3\)](#page-31-0) through the FDVAL<7:0> bits)) remains consistent with the actual frequency deviation of the companion transmitter.
- OOK reception: Ensure that the *fdev* parameter (as described in the FDEVREG register ([Register 2-3\)](#page-31-0) through the FDVAL<7:0> bits)) is equal to the frequency of the I(t) and Q(t) signals (that is, the second Intermediate Frequency, IF2, of the receiver). Note that, this IF2 equals *f<sup>o</sup>* , the center frequency of the polyphase filter.

## 3.4.7.3 Dynamic Range

The dynamic range of the RSSI is more than 70 dB, extending from the nominal sensitivity level. The IF gain, set by the IFGAIN<1:0> bits (DMODREG<1:0>), is used to achieve this dynamic range.

The RSSI response versus the input signal that is independent of the receiver filter bandwidth. However, in the absence of any input signal, the minimum value directly reflects upon the noise floor of the receiver, which is dependant on the filter bandwidth of the receiver. [Figure 3-9](#page-64-0) illustrates the RSSI Dynamic Range Response.

<span id="page-64-0"></span>

## 3.4.7.4 RSSI IRQ Source

The MRF89XA can be used to detect a RSSI level above a preconfigured threshold. The threshold is set using RTIVAL<7:0> bits (RSTHIREG<7:0>) and the IRQ status stored in the RIRQS bit (FTPRIREG<2>), which is cleared by writing a '1'.

An interrupt can be mapped to the IRQ0 or IRQ1 pins through the IRQ0RXS<1:0> and IRQ1RXS<1:0> bits (FTXRXIREG<7:6> and FTXRXIREG<5:4>). [Figure 3-10](#page-64-1) illustrates the timing diagram of the RSSI interrupt source, with the RTIVAL<7:0> bits (RSTHIREG<7:0>) set to '11100'.

<span id="page-64-1"></span>

### 3.4.8 *fdev* SETTING IN RECEIVE MODE

The effect of the *fdev* setting is different for FSK and OOK modes:

#### 3.4.8.1 FSK RX Mode

In FSK mode, the *fdev* setting as configured by FDVAL<7:0> bits (FDEVREG<7:0>), sets sampling frequencies on the receiver. The user should program the right values to make it consistent with the frequency deviation of the FSK signal that is received.

#### 3.4.8.2 OOK RX Mode

The frequency deviation *fdev*, as described previously, sets the sampling rate of the RSSI block. It is therefore necessary to set *fdev* to the recommended low-IF frequency, IF2, of 100 kHz:

 $f_{dev}$  = IF2 = 100 kHz FDVAL<7:0> = 00000011

#### 3.4.9 FSK DEMODULATOR

The FSK demodulator provides data polarity information based on the relative phase of the input I and Q signals at the baseband. Its outputs can be fed to the Bit Synchronizer to recover the timing information. The user can use the raw, unsynchronized, output of the FSK demodulator in Continuous mode.

The FSK demodulator of the MRF89XA operates effectively for FSK signals with a modulation index greater than or equal to two, as shown in [Equation 3-13](#page-65-1).

#### <span id="page-65-1"></span>**EQUATION 3-13:**

$$
\beta = \frac{2^* f_{dev}}{BRVAL} \ge 2
$$

#### 3.4.10 OOK DEMODULATOR

The OOK demodulator performs a comparison of the RSSI output and a threshold value. Three different threshold modes are available, which can be programmed through the OOKTYP<1:0> bits (DMODREG<4:3>).

The recommended mode of operation is the Peak Threshold mode, as illustrated in [Figure 3-11](#page-65-0).

In Peak Threshold mode, the comparison threshold level is the peak value of the RSSI, reduced by 6 dB. In the absence of an input signal or during the reception of a logical '0', the acquired peak value is decremented by one based on the step value of the OOKTHSV<2:0> bits (OOKCREG<7:5>) for every period value based on OOKTHPV<2:0> bits (OOKCREG<4:2>).

When the RSSI output is null for a long time (for example, after a long string of zeros is received, or if no transmitter is present), the peak threshold level will continue falling until it reaches the "Floor Threshold" that is programmed through the FTOVAL<7:0> bits (FLTHREG<7:0>).

The default settings of the OOK demodulator lead to the performance stated in [Section 5.0, Electrical](#page-102-0) [Characteristics](#page-102-0).

<span id="page-65-0"></span>**FIGURE 3-11: OOK DEMODULATOR OVERVIEW**

#### <span id="page-66-1"></span>3.4.10.1 Optimizing the Floor Threshold

The FTOVAL<7:0> bits (FLTHREG<7:0>) determine the sensitivity of the OOK receiver, as it sets the comparison threshold for weak input signals (that is, those close to the noise floor). Significant sensitivity improvements can be generated if configured correctly.

The noise floor of the receiver at the demodulator input depends on the following conditions:

- The noise figure of the receiver
- The gain of the receive chain from antenna to base band
- The matching, including SAW filter
- <span id="page-66-0"></span>• The bandwidth of the channel filters

The setting of the FTOVAL<7:0> bits are applicationdependant. The procedure shown in the flow chart in [Figure 3-12](#page-66-0) is recommended to optimize the FTOVAL<7:0> bits.

The new floor threshold value found during this test should be the value used for OOK reception with those receiver settings.

Note that if the output signal on DATA is a logic '1', the value due to the FTOVAL<7:0> bits is below the noise floor of the receiver chain. Conversely, if the output signal on DATA is a logic '1', the value due to the FTOVAL<7:0> bits is several dB above the noise floor.

#### 3.4.10.2 Optimizing OOK Demodulator Response for Fast Fading Signals

A sudden drop in signal strength can cause the bit error rate to increase. For applications, where the expected signal drop can be estimated, the OOK demodulator parameters set by the OOKTHSV<2:0> and OOK-THPV<2:0> bits (OOKCREG<7:5> and OOK-CREG<4:2>) can be optimized.

For a given number of threshold decrements per bit, specified by OOKTHPV<2:0>:

- 000  $\rightarrow$  once in each chip period (default)
- 001  $\rightarrow$  once in 2 chip periods
- 010  $\rightarrow$  once in 4 chip periods
- 011  $\rightarrow$  once in 8 chip periods
- 100  $\rightarrow$  twice in each chip period
- 101  $\rightarrow$  4 times in each chip period
- 110  $\rightarrow$  8 times in each chip period
- 111  $\rightarrow$  16 times in each chip period

For each decrement of value from OOKTHSV<2:0> bits:

- 000  $\rightarrow$  0.5 dB (default)
- 001  $\rightarrow$  1.0 dB
- 010  $\rightarrow$  1.5 dB
- $011 \rightarrow 2.0$  dB
- 100  $\rightarrow$  3.0 dB
- 101  $\rightarrow$  4.0 dB
- 110  $\rightarrow$  5.0 dB
- 111  $\rightarrow$  6.0 dB

## 3.4.10.3 Alternative OOK Demodulator Threshold Modes

In addition to the Peak OOK threshold mode, the user can alternatively select other two threshold detectors:

- Fixed threshold: The value is selected through the OOKCREG register (for more information, refer to [Section 3.4.10.1, Optimizing the Floor Threshold](#page-66-1)).
- Average threshold: Data supplied by the RSSI block is averaged with the cut-off frequency.

In [Equation 3-14,](#page-67-0) the higher cut-off frequency enables a sequence of up to eight consecutive '0's or '1's to be supported, while the lower cut-off frequency presented in [Equation 3-15](#page-67-1) allows for the correct reception of up to 32 consecutive '0's or '1's.

#### <span id="page-67-0"></span>**EQUATION 3-14:**

$$
OOKATHC < 1:0 > = 00 \Rightarrow f_{cutoff} = \frac{BRVAL < 6:0 >}{8*\pi}
$$

## <span id="page-67-1"></span>**EQUATION 3-15:**

$$
OOKATHC < 1:0 > = 11 \Rightarrow f_{cutoff} = \frac{BRVAL < 6:0 >}{32 * \pi}
$$

#### 3.4.11 BIT SYNCHRONIZER

The Bit Synchronizer (BitSync) block provides a clean and synchronized digital output that is free of glitches. [Figure 3-13](#page-68-2) illustrates the BitSync block output when a Raw Demodulator FSK or OOK output is fed to it.

<span id="page-68-2"></span>**FIGURE 3-13: BitSync BLOCK OUTPUT SIGNALS**

The BitSync can be disabled by setting the BSYNCEN bit (SYNCREG<6>) to '1' and by holding the IRQ1 pin (pin 22) low. However, for optimum receiver performance, it has to be used when the device is running in Continuous mode. With this option a DCLK signal is present on the IRQ1 pin.

The BitSync is automatically activated in Buffered and Packet modes. The bit synchronizer bit-rate is controlled by the BRVAL<6:0> bits (BRSREG<6:0>). For a given bit rate, this parameter is determined by [Equation 3-16.](#page-68-0)

#### <span id="page-68-0"></span>**EQUATION 3-16:**

$$
BR = \frac{f_{xtal}}{64*[1 + val(BRVAL<6:0>)}]
$$

For proper operation, the Bit Synchronizer must first receive three bytes of alternating logic value preamble, (that is, '0101' sequences). After this start-up phase, the rising edge of the DCLK signal is centered on the demodulated bit. Subsequent data transitions will preserve this centering. This has two implications:

- If the bit rates of Transmitter and Receiver are known to be the same, the MRF89XA will be able to receive an infinite unbalanced sequence (all '0's or all '1's) with no restriction.
- If there is a difference in bit rate between TX and RX, the amount of adjacent bits at the same level

that the BitSync can withstand. It can be estimated as given in [Equation 3-17](#page-68-1).

#### <span id="page-68-1"></span>**EQUATION 3-17:**

$$
NumberOfBits = \frac{1}{2}^* \frac{BR}{\Delta BR}
$$

This implies approximately six consecutive unbalanced bytes when the Bit Rate precision is 1%, which is easily achievable (crystal tolerance is or should be at least in the range of 50 to 100 ppm).

#### 3.4.12 ALTERNATIVE SETTINGS FOR BITSYNC AND ACTIVE FILTER

Bit Synchronizer and Active channel filter settings are a function of the reference oscillator crystal frequency, *fxtal*. Settings other than those programmable with a 12.8 MHz crystal can be obtained by selecting the correct reference oscillator frequency.

## 3.4.13 DATA OUTPUT

After OOK or FSK demodulation, the baseband signal is made available to the user on the DATA pin (pin 20), when Continuous mode is selected. In Buffered and Packet modes, the data is retrieved from the FIFO through the SPI.

During Receive mode, the received data is filled into the Shift register and then transferred onto the FIFO stack. The FIFO is configured to generate an interrupt after receiving a defined number of bits.

When the internal FIFO is enabled, the FIFO interrupt, which is configured through the IRQ0 and IRQ1 pins (pin 21 and 22), acts as a FIFOFULL interrupt, indicating that the FIFO has been filled to its preprogrammed limit. The receiver starts filling the FIFO with data when it identifies the synchronous pattern through the synchronous pattern recognition circuit. It is recommended to set the threshold to at least half the length of the register (8 bits) to ensure that the external host microcontroller has time to set up. The synchronous pattern recognition circuit prevents the FIFO from being filled up with noise, and therefore avoids overloading the external host microcontroller.

#### 3.4.14 RECEIVE MODE REGISTERS

The registers associated with Receive mode are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG [\(Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4](#page-31-1))
- FLTHREG [\(Register 2-5](#page-32-0))
- FIFOCREG ([Register 2-6](#page-32-1))
- FTXRXIREG ([Register 2-14](#page-37-0))
- FTPRIREG ([Register 2-14](#page-37-0))
- RSTHIREG ([Register 2-16](#page-40-0))
- FILCREG [\(Register 2-17](#page-41-0))
- PFCREG ([Register 2-18](#page-42-0))
- SYNCREG ([Register 2-19](#page-43-0))
- RSTSREG [\(Register 2-21](#page-44-0))
- OOKCREG [\(Register 2-22\)](#page-45-1)
- SYNCV31REG ([Register 2-23](#page-46-0))
- SYNCV23REG ([Register 2-24](#page-46-1))
- SYNCV15REG ([Register 2-25](#page-47-0))
- SYNCV07REG ([Register 2-26](#page-47-1))

## **3.5 Control Block Description**

#### 3.5.1 SPI INTERFACE

For more information on standard SPI between the MRF89XA and a Microcontroller, refer to [Section 2.11,](#page-22-0) [Serial Peripheral Interface \(SPI\).](#page-22-0)

#### 3.5.2 SPI REGISTERS

The registers associated with SPI communication are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG ([Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4\)](#page-31-1)

#### **3.6 FIFO Handling**

The hardware description of the FIFO is described in [Section 2.12, FIFO and Shift Register \(SR\)](#page-25-0). The FIFO is handled by selecting the size of the FIFO, FIFO interrupts, and clearing the FIFO.

#### 3.6.1 SIZE SELECTION

The FIFO width is programmable to 16, 32, 48 or 64 bytes using the FSIZE<1:0> bits (FIFOCREG<7:6>).

#### 3.6.2 INTERRUPT SOURCES AND FLAGS

The MRF89XA generates an interrupt request for the host microcontroller by pulling the IRQ0 or IRQ1 pins low or high based on the events and configuration settings of these interrupts. All interrupt sources and flags are configured through the Interrupt Configuration registers, based on the occurrence of the following events:

• Interrupt Requests (IRQ0 and IRQ1) during different receive stand-by data modes (such as Continuous, Buffer and Packet) for following event occurrences: SYNC, RSSI, PLREADY, ARDS-MATCH and /FIFOEMPTY.

For example, Write Byte. The WRITEBYTE interrupt source goes high for one bit period each time a new byte is transferred from the shift register to the FIFO (that is, each time a new byte is received).

• Interrupt Requests (IRQ0 and IRQ1) during transmit modes (such as Continuous, Buffer and Packet) for the following event occurrences: Data Clock, FIFOFULL, Transmit Done, Transmit Start with IRQ0 and IRQ1.

For example, TX Done. The TXDONE interrupt source goes high when the FIFO is empty and the Shift register's last bit has been sent to the modulator (that is, the last bit of the packet has been sent). One bit period delay is required after the rising edge of TXDONE to ensure correct RF transmission of the last bit. In practice this may not require special care in the MCU software due to IRQ processing time.

- Interrupt Requests (IRQ0 and IRQ1) during FIFO operations include:
	- FIFO Full: FIFOFULL interrupt source is high when the last FIFO byte (that is, the entire FIFO) is full; otherwise it is low.
	- FIFO Overrun Clear: FOVRRUN flag is set when a new byte is written by the user (in TX or Stand-by modes) or the Shift register (in RX mode) while the FIFO is full. Data is lost and the flag should be cleared by writing a '1' (note that the FIFO will be cleared).
	- FIFO Empty: FIFOEMPTY interrupt source is low when byte 0 (that is, whole FIFO) is empty; otherwise, it is high.
- **Note:** When retrieving data from the FIFO, FIFOEMPTY is updated on CSDAT falling edge (that is, when FIFOEMPTY is updated to low state the currently started read operation must be completed). In other words, the **FIFOEMPTY** state must be checked after each read operation for a decision on the next one  $(FIFOEMENTY = 1: more byte(s) to read;$ FIFOEMPTY = 0: no more bytes to read).
- FIFO Threshold: FIFO\_THRESHOLD interrupt source's behavior depends on the running mode (TX, RX or Stand-by modes) and the threshold itself can be programmed through the FIFOCREG (B value). This behavior is illustrated in [Figure 3-14](#page-70-1).

## <span id="page-70-1"></span>**FIGURE 3-14: THRESHOLD IRQ SOURCE BEHAVIOR**

All the other interrupts through RSSI, SYNC, Payload, WRITEBYTE, DCLK, PLL Lock are handled through either of these interrupts discussed in the preceding sections.

## 3.6.3 FIFO CLEARING

[Table 3-3](#page-70-0) below summarizes the status of the FIFO when switching between different modes.

#### <span id="page-70-0"></span>**TABLE 3-3: STATUS OF FIFO WHEN SWITCHING BETWEEN DIFFERENT MODES OF THE CHIP**

## 3.6.4 FIFO AND INTERRUPT REGISTERS

The registers associated with FIFO and Interrupts are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG ([Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4\)](#page-31-1)
- FLTHREG [\(Register 2-5](#page-32-0))
- FIFOCREG ([Register 2-6](#page-32-1))
- FTXRXIREG ([Register 2-14](#page-37-0))
- FTPRIREG ([Register 2-15](#page-39-0))
- RSTHIREG ([Register 2-16\)](#page-40-0)
- FILCREG [\(Register 2-17\)](#page-41-0)
- PFCREG ([Register 2-18](#page-42-0))
- SYNCREG ([Register 2-19](#page-43-0))
- RSTSREG ([Register 2-21](#page-44-0))
- OOKCREG [\(Register 2-22\)](#page-45-1)
- FCRCREG ([Register 2-32](#page-52-0))

## **3.7 Sync Word Recognition**

Sync word recognition (also called as pattern recognition) is activated by setting the SYNCREN bit (SYNCREG<5>). The bit synchronizer must be activated. The block behaves like a shift register; it continuously compares the incoming data with its internally programmed Sync word and asserts the Sync IRQ source on each occasion that a match is detected. This is illustrated in [Figure 3-15](#page-71-0).

During the comparison of the demodulated data, the first bit received is compared with bit 7 (MSb) of the byte at address 22 and the last bit received is compared with bit 0 (LSb) of the last byte whose address is determined by the length of the Sync word. When the programmed Sync word is detected the user can assume that this incoming packet is for the node and can be processed accordingly.

#### 3.7.1 CONFIGURATION

**Size:** Sync word size can be set to 8, 16, 24 or 32 bits through the SYNCWSZ<1:0> bits (SYNCREG<5:4>). In Packet mode this field is also used for Sync word generation in TX mode.

**Error Tolerance:** The number of errors tolerated in the Sync word recognition can be set to 0, 1, 2 or 3 through the SYNCTEN<1:0> bits (SYNCREG<2:1>).

**Value:** The Sync word value is configured in the Sync Word Parameters in the related Configuration Registers. In Packet mode this field is also used for Sync word generation in TX mode.

## 3.7.2 PACKET HANDLER

The packet handler is the block used in Packet mode. Its functionality is described in [Section 3.11, Packet](#page-80-0) [Mode .](#page-80-0)

#### 3.7.3 CONTROL

The control block configures and controls the behavior of the MRF89XA according to the settings programmed in the configuration registers.

#### 3.7.4 SYNC REGISTERS

The registers associated with SYNC are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG ([Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4\)](#page-31-1)
- FLTHREG [\(Register 2-5](#page-32-0))
- FIFOCREG ([Register 2-6](#page-32-1))
- FTXRXIREG ([Register 2-14](#page-37-0))
- FTPRIREG ([Register 2-15](#page-39-0))
- RSTHIREG ([Register 2-16\)](#page-40-0)
- FILCREG [\(Register 2-17\)](#page-41-0)
- PFCREG ([Register 2-18](#page-42-0))
- SYNCREG ([Register 2-19](#page-43-0))
- RSTSREG ([Register 2-21](#page-44-0))
- OOKCREG [\(Register 2-22\)](#page-45-1)
- SYNCV31REG ([Register 2-23](#page-46-0))
- SYNCV23REG ([Register 2-24](#page-46-1))

## <span id="page-71-0"></span>**FIGURE 3-15: SYNC WORD RECOGNITION**
# **3.8 Data Processing**

# 3.8.1 DATA PROCESSING BLOCK

The MRF89XA data processing blocks are as illustrated in the [Figure 3-16](#page-72-0). The role of the data processing block is to interface the data to/from the modulator/demodulator and the host microcontroller access points (SPI, Interrupts (IRQ0 and IRQ1), DATA pins). It also controls all the configuration registers.

The circuit contains several control blocks which are described in the following paragraphs.

The MRF89XA implements several data operation modes, each with their own data path through the data processing section. Depending on the data operation mode selected, some control blocks are active while others remain disabled.

# 3.8.2 DATA OPERATION MODES

The MRF89XA has three different data operation modes which can be selected by the user or programmer:

- Continuous mode: Each bit transmitted or received is accessed in real time at the DATA pin. This mode may be used if adequate external signal processing is available.
- Buffered mode: Each byte transmitted or received is stored in a FIFO and accessed through the SPI bus. The host microcontroller processing overhead reduced significantly compared to Continuous mode operation. The packet length is unlimited.
- Packet mode (recommended): User only provides/retrieves payload bytes to/from the FIFO. The packet is automatically built with preamble, Sync word, and optional CRC, DC free encoding and the reverse operation is performed in reception. The host microcontroller processing overhead is further reduced compared to Buffered mode. The maximum payload length is limited to the maximum FIFO limit of 64 bytes.

# <span id="page-72-0"></span>**FIGURE 3-16: MRF89XA DATA PROCESSING BLOCK DIAGRAM**

# **TABLE 3-4: DATA OPERATION MODE SELECTION**

# **3.9 Continuous Mode**

In Continuous mode, the NRZ data to/from the modulator/demodulator is accessed by the host microcontroller on the bidirectional DATA pin (pin 20). The SPI Data, FIFO, and packet handler are therefore inactive. [Figure 3-17](#page-73-0) illustrates the Continuous mode of operation.

<span id="page-73-0"></span>

# <span id="page-73-1"></span>**FIGURE 3-18: TX PROCESSING IN CONTINUOUS MODE**

# 3.9.1 TX PROCESSING

In TX mode, a synchronous data clock for a host microcontroller is provided on the IRQ1 pin (pin 22). Its timing with respect to the data is illustrated in [Figure 3-](#page-73-1) [18.](#page-73-1) DATA is internally sampled on the rising edge of DCLK so the microcontroller can change the logic state anytime outside the setup/hold time zone. The setup and hold times are shown in gray in the [Figure 3-18](#page-73-1).

The use of DCLK is compulsory in FSK and optional in OOK.

# 3.9.2 RX PROCESSING

If the bit synchronizer is disabled, the raw demodulator output is made directly available on the DATA pin and no DCLK signal is provided.

Conversely, if the bit synchronizer is enabled, synchronous cleaned data and clock are made available on the DATA and IRQ1 pins (pin 20 and 22). DATA is sampled on the rising edge of DCLK and updated on the falling edge as shown in [Figure 3-19.](#page-74-0)

# <span id="page-74-0"></span>**FIGURE 3-19: RX PROCESSING IN CONTINUOUS MODE**

**Note:** In Continuous mode, it is always recommended to enable the bit synchronizer to clean the DATA signal even if the DCLK signal is not used by the Microcontroller (bit synchronizer is automatically enabled in Buffered and Packet mode).

# 3.9.3 INTERRUPT SIGNALS MAPPING

The following table give the description of the interrupts available in Continuous mode.

# **TABLE 3-5: INTERRUPT MAPPING IN CONTINUOUS RX MODE**

**Note 1:** In Continuous mode, no interrupt is available in Stand-by mode.

**2:** See also the DMODE1:DMODE0 bits in the FTXRXIREG and FTPRIREG registers.

# **TABLE 3-6: INTERRUPT MAPPING IN CONTINUOUS TX MODE**

**Note 1:** In Continuous mode, no interrupt is available in Stand-by mode.

**2:** Also refer the DMODE1:DMODE0 bits in the FTXRXIREG and FTPRIREG registers for details.

# 3.9.4 HOST MICROCONTROLLER INTERFACE/REQUIRED **CONNECTIONS**

Note that some connections may not be needed depending on the application:

- IRQ0: If Sync and RSSI interrupts are not used, leave the pin floating.
- IRQ1: If the device is never used in TX FSK mode (DCLK connection is not compulsory in RX and TX OOK modes), leave the pin floating.
- SDO: If no read register access is needed, pull-up to VDD through a 100 k $\Omega$  resistor.

**Note:** The CSDAT pin (pin15), which is unused in Continuous mode, should be pulled-up to VDD through a 100  $k\Omega$  resistor. [Table 2-4](#page-17-0), details the MRF89XA pin configuration and chip mode.

# **FIGURE 3-20: HOST MCU**

### **CONNECTIONS IN CONTINUOUS MODE**

# 3.9.5 CONTINUOUS MODE EXAMPLE

The data processing related registers are appropriately configured as listed [Table 3-7.](#page-75-0) In this example we assume that both the Bit synchronizer and Sync word recognition are on.

# **TX Mode:**

- 1. Go to TX mode (and wait for TX to be ready, see [Figure 5-3\)](#page-109-0).
- 2. Send all packet bits on the DATA pin synchronously with the DCLK signal provided on IRQ1.
- 3. Go to Sleep mode.

# **RX Mode:**

- 1. Program RX interrupts: IRQ0 mapped to Sync  $(IRQ0RXS<1:0> = 00)$  and  $IRQ1$  mapped to DCLK (Bit synchronizer enabled).
- 2. Go to RX mode (note that RX is not ready immediately, see [Figure 5-2\)](#page-108-0).
- 3. Wait for Sync interrupt.
- 4. Get all packet bits on the DATA pin synchronously with the DCLK signal provided on IRQ1.
- 5. Go to Sleep mode.

# 3.9.6 CONTINUOUS MODE REGISTERS

The registers associated with Continuous mode are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG ([Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4\)](#page-31-1)
- FLTHREG [\(Register 2-5](#page-32-0))
- FIFOCREG ([Register 2-6](#page-32-1))
- FTXRXIREG ([Register 2-14](#page-37-0))
- FTPRIREG ([Register 2-15](#page-39-0))
- RSTHIREG ([Register 2-16\)](#page-40-0)
- FILCREG [\(Register 2-17\)](#page-41-0)
- PFCREG ([Register 2-18](#page-42-0))
- SYNCREG ([Register 2-19](#page-43-0))
- RSTSREG ([Register 2-21](#page-44-0))
- OOKCREG [\(Register 2-22\)](#page-45-0)
- SYNCV31REG ([Register 2-23](#page-46-0))
- SYNCV23REG ([Register 2-24](#page-46-1))
- SYNCV15REG ([Register 2-25](#page-47-0))
- SYNCV07REG ([Register 2-26](#page-47-1))

# <span id="page-75-0"></span>**TABLE 3-7: CONFIGURATION REGISTERS RELATED TO DATA PROCESSING (ONLY) IN CONTINUOUS MODE**

# **3.10 Buffered Mode**

In Buffered mode operation the NRZ data to/from the modulator or demodulator is not accessed by the host microcontroller but is stored in the FIFO and accessed via the SPI data interface. This frees the host microcontroller for other tasks between processing data from the MRF89XA. In addition, it simplifies software development overhead and reduces microcontroller performance requirements (i.e., speed, response). Note that in this mode the packet handler stays inactive. The interface for Buffer mode is shown in [Figure 3-21](#page-76-0).

An important feature is also the ability to empty the FIFO in Stand-by mode, ensuring low-power consumption and adding greater software flexibility.

# 3.10.1 TX PROCESSING

After entering TX in Buffered mode, the MRF89XA expects the host microcontroller to write to the FIFO, through the SPI data interface, and all the data bytes to be transmitted (preamble, Sync word, payload).

Actual transmission of the first byte will start either when the FIFO is not empty (that is, first byte written by the host microcontroller) or when the FIFO is full depending on the IRQ0TXST bit (FTPRIREG<4>) setting.

In Buffered mode the packet length is not limited, as long as there are bytes inside the FIFO to be sent. When the last byte is transferred to the SR, the FIFOEMPTY IRQ source is issued to interrupt the host microcontroller, when the FIFO can still be filled with additional bytes if required.

When the last bit of the last byte has left the Shift Register (SR) (i.e, eight bit periods later), the TXDONE interrupt source is issued and the user can exit TX mode after waiting at least one bit period from the last bit processed by the modulator. If the transmitter is switched OFF during transmission (for example, entering another chip mode), it will stop immediately, even if there is still unsent data.

# <span id="page-76-0"></span>**FIGURE 3-21: BUFFERED MODE BLOCK DIAGRAM**

# 3.10.2 RX PROCESSING

After entering RX in Buffered mode, the MRF89XA requires the host microcontroller to get received data from the FIFO. The FIFO will start being filled with received bytes either when a Sync word has been detected (in this case only the bytes following the Sync word are filled into the FIFO) or when the FIFOFSC bit (FPPRIREG<6>) is issued by the user depending on the state of bit, FIFOFM (FTPRIREG<7>).

In Buffered mode, the packet length is not limited that is, as long as FIFOFSC is set the received bytes are shifted into the FIFO.

The host microcontroller software must therefore manage the transfer of the FIFO contents by interrupt and ensure reception of the correct number of bytes. In this mode, even if the remote transmitter has stopped, the demodulator will output random bits due to noise.

When the FIFO is full, the FIFOFULL IRQ (source) is issued to alert the host microcontroller that at that time, the FIFO can still be unfilled without data loss. If the FIFO is not unfilled, after the SR is full (that is, 8 bits periods later) FOVRRUN is asserted and the SR's content is lost.

[Figure 3-23](#page-77-0) illustrates RX processing with a 16 byte FIFO size and FIFOFSC = 0. Note that in the example of [Section 3.10.5, Buffered Mode Example](#page-78-0), the host microcontroller does not retrieve any bytes from the FIFO through SPI data interface, causing an overrun.

# <span id="page-77-0"></span>**FIGURE 3-23: RX PROCESSING IN BUFFERED MODE (FSIZE = 16, FIFOFM = 0)**

# 3.10.3 INTERRUPT SIGNALS MAPPING

[Table 3-8](#page-78-1) and [Table 3-9](#page-78-2) describes the interrupts available in Buffered mode.

# <span id="page-78-1"></span>**TABLE 3-8: INTERRUPT MAPPING IN BUFFERED RX AND STAND-BY MODE**

**Note:** Also refer the DMODE1 and DMODE0 bits in the FTXRXIREG and FTPRIREG registers for details.

# <span id="page-78-2"></span>**TABLE 3-9: INTERRUPT MAPPING IN BUFFERED TX MODE**

**Note:** Also refer the DMODE1 and DMODE0 bits in the FTXRXIREG and FTPRIREG registers for details.

# 3.10.4 HOST MICROCONTROLLER CONNECTIONS IN BUFFERED MODE

Depending on the application, some host microcontroller connections may not be required:

- IRQ0: if none of the relevant IRQ sources are used, leave the pin floating.
- IRQ1: if none of the relevant IRQ sources are used, leave the pin floating.
- SDO: if no read register access is needed and the device is used in TX mode only. In this case, pullup to VDD through a 100 k $\Omega$  resistor.

# <span id="page-78-0"></span>3.10.5 BUFFERED MODE EXAMPLE

The data processing related registers are appropriately configured as listed in [Table 3-10.](#page-79-0) In this example we assume Sync word recognition is on and FIFOFM = 0.

# <span id="page-79-0"></span>**TABLE 3-10: CONFIGURATION REGISTERS RELATED TO DATA PROCESSING IN BUFFERED MODE**

# **TX Mode**:

- 1. Program TX start condition and IRQs: Start TX when FIFO is not empty (IRQ0TXST =  $1$ ) and IRQ1 mapped to TXDONE (IRQ1TX = 1).
- 2. Go to TX mode (and wait for TX to be ready, see [Figure 5-3\)](#page-109-0).
- 3. Write packet bytes into FIFO. TX starts when the first byte is written (IRQ0TXST = 1). Assumption: The FIFO is being filled through the SPI Data faster than being unfilled by SR.
- 4. Wait for TXDONE interrupt (+ 1 bit period).
- 5. Go to Sleep mode.

# **RX Mode:**

- 1. Program RX/Stand-by interrupts: IRQ0 mapped to FIFOEMPTY (IRQ0RXS<1:0> =  $10$ ) and IRQ1 mapped to FIFO threshold  $(IRQ1RXS<1:0>=11)$ . Configure FIFO threshold to an appropriate value (for example, to detect packet end, if its length is known).
- 2. Go to RX mode (note that RX is not ready immediately, see [Section 5.3.1, Optimized Receive](#page-107-0) [Cycle](#page-107-0) for more information).
- 3. Wait for FIFO threshold interrupt (i.e., Sync word has been detected and FIFO has filled up to the defined threshold).
- 4. If it is packet end, go to Stand-by (SR's content is lost).
- 5. Read packet byte from FIFO until FIFOEMPTY goes low (or correct number of bytes is read).
- 6. Go to Sleep mode.

# **3.11 Packet Mode**

Similar to Buffered mode operation, in Packet mode the NRZ data to/from the modulator or demodulator is not directly accessed by the host microcontroller, but it is stored in the FIFO and accessed through the SPI data interface.

The MRF89XA's packet handler also performs several packet oriented tasks such as Preamble and Sync word generation, CRC calculation/check, DC scrambling (whitening/dewhitening of data), address filtering. This simplifies the software still further and reduces microcontroller overhead by performing these repetitive tasks within the MRF89XA itself.

Another important feature is the ability to fill and empty the FIFO in Stand-by mode, ensuring optimum power consumption and adding more flexibility to the software. [Figure 3-25](#page-80-0) shows the interface diagram during Packet Mode.

**Note:** Bit Synchronizer and Sync word recognition are automatically enabled in Packet mode.

# <span id="page-80-0"></span>**FIGURE 3-25: PACKET MODE BLOCK DIAGRAM**

# 3.11.0.1 Packet Format

Two packet formats are supported: Fixed length and Variable length, which are selected by the PKTLENF bit (PKTCREG<7>). The maximum size of the payload is limited by the size of the FIFO selected (16, 32, 48 or 64 bytes).

# 3.11.0.2 Fixed Length Packet Format

In applications where the packet length is fixed in advance, this mode of operation may be useful to minimize RF overhead (no length byte field is required). All nodes, whether TX only, RX only, or TX/RX will be programmed with the same packet length value.

The length of the payload is set by the PLDPLEN<6:0> bits (PLOADREG<6:0) and is limited by the size of the FIFO selected. The length stored in this register relates only to the payload, which includes the message and the optional address byte. In this mode, the payload must contain at least one byte (that is, address or message).

A fixed length packet frame format is illustrated in [Figure 3-26,](#page-81-0) which contains the following fields:

- Preamble (1010...)
- Sync word (Network ID)
- Optional Address byte (Node ID)
- Message data
- Optional 2-bytes CRC checksum

# <span id="page-81-0"></span>**FIGURE 3-26: FIXED LENGTH PACKET FORMAT**

# 3.11.0.3 Variable Length Packet Format

This mode is necessary in applications where the length of the packet is not known in advance and can vary over time. It is then necessary for the transmitter to send the length information together with each packet in order for the receiver to operate properly.

In this mode the length of the payload, indicated by the length byte in [Figure 3-27](#page-82-0), is given by the first byte of the FIFO and is limited only by the width of the FIFO selected. In this mode, the payload must contain at least 2 bytes (that is, length plus address or message byte).

A variable length packet frame format is illustrated in [Figure 3-27,](#page-82-0) which contains the following fields:

- Preamble (1010...)
- Sync word (Network ID)
- Length byte
- Optional Address byte (Node ID)
- Message data
- Optional 2-bytes CRC checksum

**Note:** The length byte is not included in the CRC calculation.

# <span id="page-82-0"></span>**FIGURE 3-27: VARIABLE LENGTH PACKET FORMAT**

# 3.11.1 TX PROCESSING

In TX mode, the packet handler dynamically builds the packet by performing the following operations on the payload available in the FIFO:

- Add a programmable number of preamble bytes
- Add a programmable Sync word
- Optionally calculating CRC over complete payload field (optional length byte plus optional address byte plus message) and appending the 2 bytes checksum.
- Optional DC-free encoding of the data (Manchester or Whitening).

Only the payload (including optional address and length fields) is to be provided by the user in the FIFO.

Assuming that the device is in TX mode, and then depending on the setting of the IRQ0TXST bit (FTPRI-REG<4>), packet transmission (starting with programmed preamble) will start either after the first byte is written into the FIFO (IRQ0TXST =  $1$ ) or after the number of bytes written reaches the user defined threshold (IRQ0TXST = 0). The FIFO can be fully or partially filled in Stand-by mode through the FRWAXS bit (FCRCREG<6>). In this case, the start condition will only be checked when entering TX mode.

At the end of the transmission (TXDONE =  $1$ ), the user must explicitly exit TX mode if required (for example, back to Stand-by mode).

While in TX mode, before and after packet transmission (not enough bytes or TXDONE), additional preamble bytes are sent to the modulator. When the start condition is met, the current additional preamble byte is completely sent before the transmission of the next packet (that is, programmed preamble) is started.

# 3.11.2 RX PROCESSING

In RX mode the packet handler extracts the user payload to the FIFO by performing the following operations:

- Receiving the preamble and stripping off the preamble
- Detecting the Sync word and stripping off the Sync word
- Optional DC-free decoding of data
- Optionally checking the address byte
- Optionally checking CRC and reflecting the result on the STSCRCEN bit (PKTREG<0>) and CRCOK from IRQ source (for more information, refer to [Register 2-14](#page-37-0)).

Only the payload (including optional address and length fields) is made available in the FIFO.

PLREADY and CRCOK interrupts (the latter only if CRC is enabled) can be generated to indicate the end of the packet reception (for more information, refer to [Register 2-14\)](#page-37-0).

By default, if the CRC check is enabled and fails for the current packet, the FIFO is automatically cleared and neither of the two interrupts is generated and new packet reception is started. This autoclear function can be disabled via the ACFCRC bit (FCRCREG<7>) and, in this case, even if CRC fails, the FIFO is not cleared and only the PLREADY IRQ source is issued.

Once fully received, the payload can also be fully or partially retrieved in Stand-by mode from the FRWAXS bit. At the end of the reception, although the FIFO automatically stops being filled, it is still up to the user to explicitly exit RX mode if required (for example, go to Stand-by mode to get payload). The FIFO must be empty for a new packet reception to start.

# 3.11.3 PACKET FILTERING

MRF89XA packet handler offers several mechanisms for packet filtering ensuring that only useful packets are made available to the host microcontroller, significantly reducing system power consumption and software complexity.

# 3.11.3.1 Sync Word-Based

Sync word filtering or recognition is enabled in Packet mode. It is used for identifying the start of the payload and also for network identification. As described earlier, the Sync word recognition block is configured (with size, error tolerance, value) from the SYNCREN, SYN-CWSZ, SYNCTEN, SYNCV31-0 bits in the SYNCREG, SYNCV31REG, SYNCV23REG, SYNCV15REG and SYNCV07REG Configuration registers. This information is used for appending Sync word in TX and filtering packets in RX.

Every received packet that does not start with this locally configured Sync word is automatically discarded and no interrupt is generated.

When the Sync word is detected, payload reception automatically starts and the Sync IRQ source is issued.

# 3.11.3.2 Length Based

In variable length Packet mode, the PLDPLEN<6:0> bits (PLOADREG<6:0>) must be programmed with the maximum length permitted. If the received length byte is smaller than this maximum, the packet is accepted and processed; otherwise, it is discarded.

To disable this function the user should set the value of the PLDPLEN<6:0> bits to the value of the FIFO size selected.

**Note:** The received length byte, as part of the payload, is not stripped off the packet and is made available in the FIFO.

# 3.11.3.3 Address Based

Address filtering can be enabled through the ADDFIL<1:0> bits (PKTCREG<2:1>). It adds another level of filtering above Sync word, which is typically useful in multi-node networks where a network ID is shared between all nodes (Sync word) and each node has its own ID (address).

Three address based filtering options are available:

- ADDFIL = 01: Received address field is compared with the internal register, NADDSREG. If they match, the packet is accepted and processed; otherwise, it is discarded.
- ADDFIL = 10: Received address field is compared with the internal register, NADDSREG, and the constant 0x00. If either is a match, the received packet is accepted and processed; otherwise, it is discarded. This additional check with a constant is useful for implementing broadcast in multi-node networks.
- ADDFIL = 11: Received address field is compared with the internal register, NADDSREG, and the constants 0x00 and 0xFF. If any of the three matches, the received packet is accepted and processed, otherwise it is discarded. These additional checks with constants are useful for implementing broadcast commands of all nodes.

Here the received address byte, as part of the payload, is not stripped off the packet and is made available in the FIFO. In addition, NADDSREG and ADDFIL<1:0> bits from PKTCREG only apply to RX. On TX side, if address filtering is expected, the address byte should be put into the FIFO like any other byte of the payload.

# 3.11.3.4 CRC-Based

The CRC check is enabled by setting the CHKCRCEN bit (PKTCREG<3>). This bit is used for checking the integrity of the message. A 16-bit CRC checksum is calculated on the payload part of the packet and is appended to the end of the transmitted message. The CRC checksum is calculated on the received payload and compared to the transmitted CRC. The result of the comparison is stored in the STSCRCEN bit (PKTCREG<0>) and an interrupt can also be generated on IRQ1.

- On the TX side a two byte CRC checksum is calculated on the payload part of the packet and appended to the end of the message.
- On the RX side the checksum is calculated on the received payload and compared with the two checksum bytes received. The result of the comparison is stored in the STSCRCEN bit from and the CRCOK IRQ source (refer to [Register 2-14](#page-37-0) for details).

By default, if the CRC check fails, the FIFO is cleared and no interrupt is generated. This filtering function can be disabled through the ACFCRC bit (FCRCREG<7>) and if CRC fails, the FIFO is not cleared and only the PLREADY interrupt goes high (for more information, refer to [Register 2-14](#page-37-0)). In both the cases, the two CRC checksum bytes are stripped off by the packet handler and only the payload is made available in the FIFO.

The CRC is based on the CCITT polynomial as illustrated in [Figure 3-28](#page-84-0). This implementation also detects errors due to leading and trailing zeros. For more information on CRC polynomial computation in C#, see **[Appendix B: "CRC Computation in C# \(convertible](#page-131-0) [to c\)"](#page-131-0)**

# <span id="page-84-0"></span>**FIGURE 3-28: CRC POLYNOMIAL IMPLEMENTATION**

# 3.11.4 DC-FREE DATA MECHANISMS

The payload to be transmitted may contain long sequences of '1's and '0's, which introduces a DC bias in the transmitted signal, which causes a non-uniform power distribution spectrum over the occupied channel bandwidth. These sequences also degrade the performance of the demodulation and data, and clock recovery functions in the receiver, which basically introduces data dependencies in the normal operation of the demodulator. System performance can be enhanced if the payload bits are randomized to reduce DC biases and increase the number of bit transitions. Therefore, it is useful if the transmitted data is random and DC-free.

To handle such instances, two techniques are available in the packet handler: Manchester encoding and Data Whitening. However, only one of the two methods should be enabled at a time.

# 3.11.4.1 Manchester Data Encoding

Manchester encoding/decoding is enabled by setting the MCHSTREN bit (PLOADREG<7>) and can be used in Packet mode only. The NRZ data is converted to Manchester code by coding '1' as '10' and '0' as '01'.

[Figure 3-29](#page-85-0) illustrates Manchester data encoding. NRZ data is converted to Manchester by encoding 1 bits as 10 chip sequences, and 0 bits as 01 chip sequences. Manchester encoding guarantees DC-balance and frequent data transitions in the encoded data. The maximum Manchester chip rate corresponds to the maximum bit rate given in the Transmitter Electrical specifications in [Table 5-6.](#page-106-0)

In this case, the maximum chip rate is the maximum bit rate given in the specifications section and the actual bit rate is half the chip rate. Manchester encoding and decoding is only applied to the payload and CRC checksum while preamble and Sync word are kept NRZ. However, the chip rate from preamble to CRC is the same and defined by the BRVAL<6:0> bits (BRSREG<6:0>) (Chip Rate = Bit Rate NRZ = 2 x Bit Rate Manchester).

Therefore Manchester encoding/decoding is made transparent for the user, who still provides/retrieves NRZ data to/from the FIFO. See the Manchester encoding/decoding bit pattern in [Figure 3-30](#page-85-1).

# 3.11.4.2 Data Whitening

Another technique called data whitening or scrambling is widely used for randomizing the user data before radio transmission. The data is whitened using a random sequence on the TX side and dewhitened on the RX side using the same sequence. Compared to Manchester technique it has the advantage of retaining the NRZ data rate (that is, actual bit rate is not halved).

The whitening/dewhitening process is enabled by setting the WHITEN1 bit (PKTCREG<4>). A 9-bit Linear Feedback Shift Register (LFSR) is used to generate a random sequence. The payload and 2-byte CRC checksum is then XORed with this random sequence as illustrated in [Figure 3-31](#page-86-0). The data is dewhitened on the receiver side by XORing with the same random sequence.

Payload whitening/dewhitening is made transparent for the user, who still provides/retrieves NRZ data to/from the FIFO.

<span id="page-85-0"></span>

# <span id="page-85-1"></span>**FIGURE 3-30: MANCHESTER ENCODING/DECODING**

# <span id="page-86-0"></span>**FIGURE 3-31: DATA WHITENING**

# 3.11.5 INTERRUPT SIGNAL MAPPING

[Table 3-11](#page-86-1) and [Table 3-12](#page-86-2) provides the descriptions of the interrupts available in Packet mode.

<span id="page-86-1"></span>

**Note 1:** Address Match valid only if Address Filtering is Enabled.

**2:** Also refer the DMODE1 and DMODE0 bits in the FTXRXIREG and FTPRIREG registers for details.

# <span id="page-86-2"></span>**TABLE 3-12: INTERRUPT MAPPING IN TX PACKET MODE**

**Note:** Also refer the DMODE1 and DMODE0 bits in the FTXRXIREG and FTPRIREG registers for details.

# 3.11.6 HOST MICROCONTROLLER INTERFACE CONNECTIONS IN PACKET MODE

Depending on the application, some of the host microcontroller connections may not be needed:

- IRQ0: If none of the relevant IRQ sources are used. In this case, leave the pin floating.
- IRQ1: If none of the relevant IRQ sources are used. In this case, leave the pin floating.
- SDO: If no read register access is needed and the device is used in TX mode only. In this case, pull up to VDD through a 100 k $\Omega$  resistor.
	- **Note:** The DATA pin (pin 20), which is unused in Packet mode, should be pulled-up to VDD through a 100 k $\Omega$  resistor. [Table 2-4](#page-17-0), provides details about MRF89XA pin configuration and chip mode.

# **FIGURE 3-32: HOST MCU**

### **CONNECTIONS IN PACKET MODE**

# 3.11.7 PACKET MODE EXAMPLE

The data processing related registers are appropriately configured as shown in [Table 3-13](#page-87-0). In this example we assume CRC is enabled with autoclear on.

# <span id="page-87-0"></span>**TABLE 3-13: CONFIGURATION REGISTERS RELATED TO DATA PROCESSING (ONLY) IN PACKET MODE**

**Note 1:** Fixed format only.

# **TX Mode:**

- 1. Program TX start condition and IRQs: Start TX when FIFO is not empty (IRQ0TXST =  $1$ ) and IRQ1 mapped to TXDONE (IRQ1TX = 1)
- 2. Set CMOD = Stand-by mode and enable FIFO access in Stand-by mode.
- 3. Write all payload bytes into FIFO (FRWAXS =  $0$ , Stand-by interrupts can be used if needed).
- 4. Go to TX mode. When TX is ready (automatically handled) TX starts (IRQ0TXST =  $1$ ).
- 5. Wait for TXDONE interrupt (plus one bit period).
- 6. Go to Sleep mode.

# **RX Mode:**

- 1. Program RX/Stand-by interrupts: IRQ0 mapped to FIFOEMPTY (IRQ0RXS = 10) and IRQ1 mapped to FIFO Threshold (IRQ1RXS = 00). Configure FIFO Threshold to an appropriate value (for example, to detect packet end, if its length is known).
- 2. Go to RX mode by setting the CMOD register. FIFO threshold interrupt, when the FIFO is full with received contents. So you have to enable IRQ1 to "CRCOK" interrupt.
- 3. Wait for CRCOK interrupt.
- 4. Go to Stand-by mode.
- 5. Read payload byte from FIFO until FIFOEMPTY goes low. (FRWAXS =  $1$ ).
- 6. Go to Sleep mode.

# 3.11.8 ADDITIONAL INFORMATION TO HANDLE PACKET MODE

If the number of bytes filled for transmission is greater than the actual length of the packet to be transmitted and IRQ0TXST =  $1$ , the FIFO is cleared after the packet has been transmitted. Therefore, the extra bytes in the FIFO are lost. Otherwise, if IRQ0TXST = 0, the extra bytes are kept in the FIFO. This opens up the possibility of transmitting more than one packet by filling the FIFO with multiple packet messages.

It is not possible to receive multiple packets. After a packet has been received and filled in the FIFO all its contents needs to be read (that is, the FIFO must be empty for a new packet reception to be initiated).

The PLREADY interrupt goes high when the last payload byte is available in the FIFO and remains high until all its data are read. Similar behavior is applicable to ARDSMATCH and CRCOK interrupts.

The CRC result is available in the STSCRCEN bit immediately as the CRCOK and PLREADY interrupt sources are triggered. In RX mode, the STSCRCEN bit is cleared when the complete payload has been read from the FIFO. If the payload is read in Stand-by mode, the STSCRCEN bit is cleared when the user goes back to RX mode and a new Sync word is detected.

The FIFOFM and FIFOFSC bits have no meaning in Packet mode and should be set to their default values only.

# 3.11.9 PACKET MODE REGISTERS

The registers associated with Packet mode are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG ([Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4\)](#page-31-1)
- FLTHREG [\(Register 2-5](#page-32-0))
- FIFOCREG ([Register 2-6](#page-32-1))
- FTXRXIREG ([Register 2-14](#page-37-0))
- FTPRIREG ([Register 2-15](#page-39-0))
- RSTHIREG ([Register 2-16\)](#page-40-0)
- FILCREG [\(Register 2-17\)](#page-41-0)
- PFCREG ([Register 2-18](#page-42-0))
- SYNCREG ([Register 2-19](#page-43-0))
- RSTSREG ([Register 2-21](#page-44-0))
- OOKCREG [\(Register 2-22\)](#page-45-0)
- SYNCV31REG ([Register 2-23](#page-46-0))
- SYNCV23REG ([Register 2-24](#page-46-1))
- SYNCV15REG ([Register 2-25](#page-47-0))
- SYNCV07REG ([Register 2-26](#page-47-1))
- PLOADREG [\(Register 2-29\)](#page-50-0)
- NADDSREG [\(Register 2-30\)](#page-50-1)
- PKTCREG ([Register 2-31](#page-51-0))
- FCRCREG ([Register 2-32](#page-52-0))

# **3.12 Initialization**

Certain control register values must be initialized for basic operations of the MRF89XA. These values differ from the POR values and provide improved operational parameters. These settings are normally made once after a Reset. After initialization, the other features of the MRF89XA device can be configured based on the application. Accessing a register is implied as a command to the MRF89XA device through the SPI port.

The steps to initialize the MRF89XA using the control registers are as follows:

- 1. In the GCONREG register:
	- a) Set the Chip Mode (CMOD<2:0>), Frequency Band (FBS<1:0>) and VCO Trim (VCOT<1:0>) bits.
	- b) Program the Frequency band.
	- c) Set the Trim bits to appropriately tune in the VCO.
- 2. In the DMODREG register:
	- a) Select the Modulation Type using the MOD-SEL<1:0> bits.
	- b) Enable DATA mode for Transmission using the DMODE0 and DMODE1 bits.
	- c) Select gain for IF chain using the IFGAIN<1:0> bits.
	- d) In the FDEVREG register, program the Frequency Deviation bits (FDVAL<7:0>).
- 3. In the BRSREG register, program the Bit Rate using the BRVAL<6:0> bits.
- 4. In the FLTHREG register, set the Floor Threshold for OOK using the FTOVAL<7:0> bits.
- 5. In the FIFOCREG register, configure the FIFO Size and FIFO Threshold using the FSIZE<1:0> and FTINT<5:0> bits.
- 6. In the PACREG register, configure the Power Amplifier Ramp Control using the PARC<1:0> bits.
- 7. In the FTXRXIREG register:
	- a) Configure the RX interrupts for IRQ0 and IRQ1 using the IRQ0RXS<1:0> and IRQ1RXS<1:0> bits.
	- b) Configure the TX interrupts for IRQ1 using the IRQ1TX bit.
- 8. In the FTPRIREG register:
	- a) Configure the TX interrupts for IRQ0 using the IRQ0TXST bit.
	- b) Enable PLL Lock for interrupt on IRQ1 using the LENPLL bit.
- 9. In the RSTHIREG, program the RSSI Threshold value for interrupt request using the RTIVAL<7:0> bits.
- 10. In the FILCREG register, enable the Passive Filter using the PASFILV<3:0> bits.
- 11. Configure RX parameters:
- a) Enable Passive Filter with value as set in step 11.
- b) Set  $f_c$  and  $f_o$ .
- c) Enable SYNC and Set SYNC Word, Size, Length and Tolerance.
- d) Set configuration bytes for OOK Threshold from OOKCREG
- 12. In the SYNCREG register, set  $SYNCWSZ < 1:0$  = 11 for 32-bit SYNC word.
- 13. Configure TX parameters:
	- a) Change or Reset *f<sup>c</sup>* .
	- b) In the TXCONREG register, enable TX and its transmit power using the TXIPOLFV<3:0> and TXOPVAL<2:0> bits.
- 14. In the CLKOUTREG register, configure the Clock Settings using the CLKOCNTRL and CLKOFREQ<4:0> bits.
- 15. Configure the Packet Frame parameters in the PLOADREG, NADDSREG, PKTCREG and FCRCREG registers:
	- a) Enable Manchester Encoding
	- b) Set packet format and length of the packet
	- c) Set Node local address
	- d) Program preamble variables
	- e) Configure CRC parameters
	- f) Enable Address Filtering
- 16. In the FCRCREG register, enable FIFO write access using the FRWAXS bit.
	- **Note 1:** Program registers 0x00 0x1F with appropriate settings. (General Configuration Parameters, IRQ Parameters, Packet Parameters).
		- **2:** Clear the PLL Lock flag by setting the LSTSPLL bit (FTPRIREG 0x0E<1>) to '1'.
		- **3:** Program CMOD bits (GCONREG 0x00 <7:5>) to '0b010 Frequency Synthesizer mode.
		- **4:** Verify the PLL lock flag through the LST-SPLL bit (FTPRIREG 0x0E<1>). If LST- $SPLL = 1$ , it implies that the MRF89XA is ready to operate at the frequency indicated by the Ri/Pi/Si register set.
		- **5:** Program the CMOD bits (GCONREG 0x00 <7:5>) to '0b001 Standby mode.

# **3.13 Battery Power Management Configuration Values**

Battery life can be greatly extended in MRF89XA applications where transmissions from field nodes are infrequent, or network communications can be concentrated in periodic time slots. For example, field nodes in many wireless alarm systems report operational status a few times a day, and can otherwise sleep unless an alarm condition occurs. Sensor networks that monitor parameters that change relatively slowly, such as air and soil temperature in agricultural settings, switching lights ON/OFF, only need to transmit updates a few times per an hour.

At room temperature, the MRF89XA draws a maximum of 1  $\mu$ A in Sleep mode, with a typical value of 100 nA. To achieve minimum Sleep mode current, the CSCON pin (pin 14), SDI pin (pin 17) and SCK pin (pin 18) must be held logic low, while the CSDAT pin (pin 15) and SDO pin (pin 16) must be held logic high.

The MRF89XA can go from Sleep mode through Stand-by mode and Synthesizer mode to Transmit (or Receive) mode in less than 6 ms. For configuring and driving the device different operating modes refer to [Table 2-3.](#page-17-1) At a data rate of 33.33 kbps, a 32-byte packet with a 4-byte preamble and a 4-byte start pattern takes about 10 ms to transmit. Assume that the MRF89XA then switches to Receive mode for one second to listen for a response and returns to Sleep mode. On the basis of reporting every six hours, the ON to Sleep duty cycle is about 1:21,259, greatly extending battery life over continuous transmit-receive or even stand-by operation.

The required timing accuracy for the microcontrollers in a sleep-cycled application depends on several factors:

- The required "time-stamp" accuracy of data reported by sleeping field nodes. R-C Sleep mode timers built into many microcontrollers have a tolerance of ±20% or more. For applications that require more accurate time-stamping, many microcontrollers can run on a watch crystal during Sleep mode and achieve time-stamp accuracies better than one second per 24 hours.
- If the base station and any routing nodes present in a network must sleep cycle in addition to the field nodes. Watch crystal control will usually be needed to keep all nodes accurately synchronized to the active time slots.
- If the base station and any routing nodes present in a network can operate continuously (AC powered, solar charged batteries), and a loose time stamp accuracy is OK, the microcontrollers in sleeping field nodes can usually operate from internal low-accuracy R-C timers

**Note:** Many host microcontrollers cannot be operated from the MRF89XA buffered clock output if sleep cycling is planned. In Sleep mode, the MRF89XA buffered clock output is disabled, which will disable the microcontroller unless it is capable of automatically switching to an internal clock source when external clocking is lost.

Therefore, as previously mentioned, Sleep mode is the lowest power consumption mode in which the clock and all functional blocks of the device are disabled. In case of an interrupt, the device wakes up, switches to Active mode and an interrupt signal generated on the IRQ pin indicates the change in state to the host microcontroller. The source of the interrupt can be determined by reading the status word of the device.

To reduce current consumption, the MRF89XA should be placed in the low-power consuming Sleep mode. In Sleep mode, the 12.8 MHz main oscillator is turned OFF, disabling the RF and baseband circuitry. Data is retained in the control and FIFO registers and the transceiver is accessible through the SPI port. The MRF89XA will not enter Sleep mode if any interrupt remains active, regardless of the state of the CLKOCNTRL bit (CLKOUTREG<7>). This way, the microcontroller can always have a clock signal to process the interrupt. To prevent high-current consumption, which results in shorter battery life, it is highly recommended to process and clear interrupts before entering Sleep mode. The functions which are not necessary should be turned off to avoid unwanted interrupts. To minimize current consumption, the MRF89XA supports different power-saving modes, along with an integrated wake-up timer.

When switching from Sleep mode to Stand-by mode, the crystal oscillator will be active for no more than 5 ms. Switching from Stand-by mode to Synthesizer mode, the PLL will lock in less than 0.5 ms. PLL lock can be monitored on the PLOCK pin (pin 23) of the MRF89XA. The radio can then be switched to either Transmit or Receive mode. When switching from any other mode back to Sleep mode, the device will drop to its Sleep mode current in less than 1 ms.

To make the MRF89XA device enter into Sleep mode, certain control register values must be initialized. The sequence to program the control registers for entering into Sleep mode and Wake-up modes are as follows:

For Sleep mode:

- 1. Check the IRQ bit status
- 2. Handle Interrupts
- 3. Configure the GCONREG register
- 4. Set/Reset CLKOUT in the CLKOUTREG register

# **EXAMPLE 3-1: TO PUT THE MRF89XA INTO SLEEP MODE**

Set CMOD<2:0> (GCONREG<2:0>) = 0

The MRF89XA device can wake up from any interrupt activity.

For Wake-up mode perform any one the following task:

- Enter in TX/RX mode
- Enable CLKOUT
- Set the INT pin

# **EXAMPLE 3-2: TO WAKE THE MRF89XA FROM SLEEP MODE**

Set CMOD<2:0> (GCONREG<2:0>) = 1

# 3.13.1 POWER-SAVING MODE **REGISTERS**

The registers associated with power-saving modes are:

- GCONREG ([Register 2-1](#page-29-0))
- DMODREG [\(Register 2-2\)](#page-30-0)
- FDEVREG ([Register 2-3](#page-31-0))
- BRSREG [\(Register 2-4\)](#page-31-1)
- FTXRXIREG ([Register 2-14](#page-37-0))
- FTPRIREG ([Register 2-15](#page-39-0))
- CLKOUTREG [\(Register 2-28\)](#page-49-0)

# $4.0$ **4.0 APPLICATION DETAILS APPLICATION DETAILS**

# 4.1 Application Schematic **4.1 Application Schematic**

<span id="page-92-0"></span>a matching circuit of the SA An application circuit schematic of the MRF89XA with W filter and antenna is illustrated in [Figure 4-1.](#page-92-0) This application design (that is,

DS70622C-page 93 DS70622C-page 93

# **4.1 RF Transmitter Matching**

The optimum load for the RF port at a given frequency band is listed in [Table 4-1](#page-93-0). These load values in the table are expected by the RF port pins to have as an antenna load for maximum power transfer. For all antenna applications, an RF choke inductor (L2) must be included during transmission because the RF outputs are of open-collector type.

# **4.2 Antenna Components**

The MRF89XA is single-ended and has an unbalanced input and output impedance close to 30-j25. Therefore, it only requires a matching circuit to the SAW filter and antenna. The C11, C12, and L6 are part of the matching network these components make for the antenna circuit. L1, C4, and C5 are tuned to provide that impedance (30+j25) to the RFIO pin. In this case, the transceiver will be able to transfer all power toward the antenna. This impedance is called Optimum Load Impedance. L2 is a RF choke inductor. L3 and L4 are basically VCO inductors. The details are shown in [Figure 4-1.](#page-92-1)

# <span id="page-93-0"></span>**TABLE 4-1: ANTENNA LOAD VALUES FOR 868 MHz AND 915 MHz FREQUENCY BANDS**

**Note 1:** The SAW filter can be of EPCOS (B3717 and B3588) or Taisaw (TA0801A and TA0281A) for 868 MHz and 915 MHz respectively with matching components remaining the same as shown in [Figure 4-1](#page-92-1) and [Table 4-1](#page-93-0).

# **4.3 SAW FILTER**

FL1 is a SAW filter. While in Transmitting mode, the SAW filter is used to suppress the harmonics. While in Receiving mode, the SAW filter is used to reject the image frequencies and out-of-band interfering signals.

# 4.3.1 SAW FILTER PLOT

[Figure 4-2](#page-94-0) and [Figure 4-3](#page-94-1) illustrates the plots of the SAW filter used in the application circuit. The plots shown are representative. For exact specifications, refer to the SAW Filter manufacturer data sheet.

<span id="page-94-0"></span>

<span id="page-94-1"></span>

© 2010–2011 Microchip Technology Inc. **Preliminary** DS70622C-page 95

# **4.4 POWER AMPLIFIER**

The Power Amplifier (PA) integrated in the MRF89XA operates under a regulated voltage supply of 1.8V. The external RF choke inductor is biased by an internal regulator output made available on the PARS pin (pin 29). These features help PA output power to be consistent over the power supply range. This is important for applications that allow predictable RF performance and battery life.

# 4.4.1 OPTIMUM LOAD IMPEDANCE

As the PA and the LNA front-ends in the MRF89XA share the same input/output pin, they are internally matched to approximately 50 $\Omega$ . [Figure 4-4](#page-95-0) illustrates optimum load impedance of RFIO through an impedance chart.

<span id="page-95-0"></span>

**Note:** Refer to [Section 4.7, Bill of Materials](#page-98-0) for an optimized PA load setting.

# 4.4.2 SUGGESTED PA BIASING AND MATCHING

The recommended PA bias and matching circuit is illustrated in [Figure 4-5.](#page-96-0)

<span id="page-96-0"></span>**FIGURE 4-5: RECOMMENDED PA BIASING AND OUTPUT MATCHING**

Refer to [Section 4.7, Bill of Materials](#page-98-0) for the optimized matching arrangement for each frequency band.

# 4.4.3 COMMON INPUT AND OUTPUT FRONT-END

The Receiver and Transmitter share the same RFIO pin (pin 31). [Figure 4-6](#page-96-1) illustrates the configuration of the common RF front-end.

In Transmit mode, the PA and PA regulator are active, with the voltage on the PARS pin equal to the nominal voltage of the regulator (1.8V). The external inductance is used to bias the PA.

In Receive mode, both the PA and PA regulator are OFF and PARS is tied to ground. The RF choke inductor is then used to bias the LNA.

<span id="page-96-1"></span>

# 4.4.4 PLL LOOP FILTER

To adequately reject spurious components arising from the comparison frequency FCOMP, an external second order loop filter is used. [Figure 4-7](#page-97-1) illustrates the loop filter circuit.

<span id="page-97-1"></span>

The recommendations made in [Section 3.2.4.1, PLL](#page-56-0) [Requirements](#page-56-0) and the loop filter proposed in the application schematic's BOM in [Section 4.7, Bill of Materials](#page-98-0) can be used. The loop filter settings are frequency band independent and are hence relevant to all implementations of the MRF89XA.

# 4.4.5 VOLTAGE CONTROLLED OSCILLATOR (VCO)

The integrated VCO requires only two external tank circuit inductors. As the input is differential, the two inductors should have the same nominal value. The performance of these components is important for both the phase noise and the power consumption of the PLL.

It is recommended that a pair of high Q factor inductors is selected. These should be mounted orthogonally to other inductors (in particular the PA choke) to reduce spurious coupling between the PA and VCO. These measures may reduce radiated pulling effects and undesirable transient behavior, thus minimizing spectral occupancy. Ensuring a symmetrical layout of the VCO inductors will improve PLL spectral purity.

# **4.5 VDD Line Filtering**

During the Reset event (caused by power-on, a glitch on the supply line or a software Reset), the VDD line should be kept clean. Noise or a periodic disturbing signal superimposed on the supply voltage may prevent the device from getting out of the Reset state. To avoid this, adequate filters should be made available on the power supply lines to keep the distorting signal level below 100-150 mV peak-to-peak, in the DC to 50 kHz range for 200 ms, from VDD ramp start. The usage of regulators or switching power supplies may sometimes introduce switching noise on the VDD line, hence follow the power supply manufacturer's recommendations on how to decrease the ripple of regulator IC and/or how to shift the switching frequency.

# **4.6 Crystal Specification and Selection Guidelines**

[Table 4-2](#page-97-0) lists the crystal resonator specification for the crystal reference oscillator circuit of the MRF89XA. This specification covers the full range of operation of the MRF89XA and is used in the application schematic (for more information, see [Section 4.7, Bill of Materi](#page-98-0)[als](#page-98-0)).

<b>Name</b>	<b>Description</b>	<b>Minimum</b>	<b>Typical</b>	<b>Maximum</b>	<b>Units</b>
$f_{xtal}$	Nominal frequency	9	12.800	15	<b>MHz</b>
<b>CLOAD</b>	Load capacitance for $f_{xtal}$	10	15	16.5	рF
<b>RM</b>	Motional resistance			100	Ohms
Co	Shunt capacitance				pF
$\Delta f_{xtal}$	Calibration tolerance at 25+/-3°C	$-15$		$+15$	ppm
$\Delta f_{xtal}(\Delta T)$	Stability over temperature range [-40°C; +85°C]	$-20$		$+20$	ppm
$\Delta f_{xtal}(\Delta t)$	Aging (first year)	5		5	ppm

<span id="page-97-0"></span>**TABLE 4-2: CRYSTAL RESONATOR SPECIFICATION**

**Note:** The initial frequency tolerance, temperature stability and ageing performance should be chosen in accordance with the target operating temperature range and the receiver bandwidth selected.

# **TABLE 4-3: MRF89XA APPLICATION SCHEMATIC BILL OF MATERIALS FOR 868 MHz**

**Note:** For battery powered applications, a high value capacitance should be implemented in parallel with C1 (typically 10  $\mu$ F) to offer a low impedance voltage source during startup sequences.

# **TABLE 4-4: MRF89XA APPLICATION SCHEMATIC BILL OF MATERIALS FOR 915 MHZ**

**Note:** For battery powered applications, a high value capacitance should be implemented in parallel with C1 (typically 10  $\rm \mu F$ ) to offer a low impedance voltage source during startup sequences.

# **4.8 General PCB Layout Design**

The following guidelines can be used to assist in highfrequency PCB layout design.

The printed circuit board is usually comprised of two or four basic FR4 layers.

The two-layer printed circuit board has mixed signal/ power/RF and common ground routed in both the layers (see [Figure 4-8](#page-100-0)).

The four-layer printed circuit board (see [Figure 4-9](#page-101-0)) is comprised of the following layers:

- Signal layout
- RF around
- Power line routing
- Common ground

The following guidelines explain the requirements of the previously mentioned layers:

- It is important to keep the original PCB thickness, because any change will affect antenna performance (see total thickness of dielectric) or microstrip lines' characteristic impedance.
- For good transmit and receive performance, the trace lengths at the RF pins must be kept as short as possible. Using small, surface mount components (in 0402/0603 package) yields good performance and keeps the RF circuit small. RF connections should be short and direct.
- Except for the antenna layout, avoid sharp corners because they can act as an antenna. Round corners will eliminate possible future EMI problems.
- Digital lines are prone to be very noisy when handling periodic waveforms and fast clock/switching rates. Avoid RF signal layout close to any of the digital lines.
- A VIA filled ground patch underneath the IC transceiver is mandatory.
- The power supply must be distributed to each pin in a star topology, and low-ESR capacitors must be placed at each pin for proper decoupling noise.
- Thorough decoupling on each power pin is beneficial for reducing in-band transceiver noise, particularly when this noise degrades performance. Usually, low value caps (27-47 pF) combined with large value caps (100 nF) will cover a large spectrum of frequency.
- Passive component (inductors) should be in the high-frequency category and the Self-Resonant Frequency (SRF) should be at least two times higher than the operating frequency.
- The additional trace length affects the crystal oscillator by adding parasitic capacitance to the overall load of the crystal. To minimize this, place the crystal as close as possible to the RF device.
- Setting short and direct connections between the components on board minimizes the effects of "frequency pulling" that might be introduced by stray capacitance. It even allows the internal load capacitance of the chip to be more effective in properly loading the crystal oscillator circuit.
- Long run tracks of clock signal may radiate and cause interference. This can degrade receiver performance and add harmonics or unwanted modulation to the transmitter.
- Keep clock connections as short as possible and surround the clock trace with an adjacent ground plane pour. Pouring helps in reducing any radiation or crosstalk due to long run traces of the clock signal.
- Low value decoupling capacitors, typically 0.01-0.1 µF, should be placed for VDD of the chip and for bias points of the RF circuit.
- High value decoupling capacitors, typically 2.2-10 µF, should be placed at the point where power is applied to the PCB.
- Power supply bypassing is necessary. Poor bypassing contributes to conducted interference, which can cause noise and spurious signals to couple into the RF sections, significantly reducing the performance.

# Signal/Power/RF and Common Ground Dielectric Constant = 4.5 Signal/Power/RF and Common Ground

# <span id="page-100-0"></span>**FIGURE 4-8: TWO BASIC COPPER FR4 LAYERS**

# <span id="page-101-0"></span>**FIGURE 4-9: FOUR BASIC COPPER FR4 LAYERS**

# **5.0 ELECTRICAL CHARACTERISTICS**

# **Absolute Maximum Ratings(†)**

**Note 1:** At maximum, voltage on RFIO cannot be higher than 6V.

**NOTICE:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

# **5.1 ESD Notice**

The MRF49XA is a high-performance radio frequency device, it satisfies:

- Class II of the JEDEC standard JESD22-A114-B (Human Body Model) of 2 KV, except on all of the RF pins where it satisfies Class 1A.
- Class III of the JEDEC standard JESD22-C101C (Charged Device Model) on all pins.

It should thus be handled with all the necessary ESD precautions to avoid any permanent damage.

# **TABLE 5-1: RECOMMENDED OPERATING CONDITIONS**

**Note 1:** At minimum, VDD – 1.5V should not be lower than 1.8V.

**2:** At maximum, VDD + 1.5V should not be higher than 3.7V.

# **TABLE 5-2: CURRENT CONSUMPTION(3)**

**Note 1:** Guaranteed by design and characterization.

**2:** Crystal CLOAD = 10 pF, C0 = 2.5 pF, RM = 15Ω.

**3:** Measurement Conditions: Temp = 25°C, VDD = 3.3V, crystal frequency = 12.8 MHz, carrier frequency = 868 or 915 MHz, modulation FSK, data rate = 25 kbps, *fdev* = 50 kHz, *f<sup>c</sup>* = 100 kHz, unless otherwise specified.

## **TABLE A-2: OOK RX FILTERS VS. BIT RATE**

**Note 1:** To comply with any regulatory body like FCC for example with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation. For regulated FSK and OOK settings, see MRF89XA device module data sheet from Microchip Website.

# <span id="page-131-0"></span>**APPENDIX B: CRC COMPUTATION IN C# (CONVERTIBLE TO C)**

```
const ushort Polynome = 0x1021; 
//Polynome = X^16+X^12+X^5+1 
ushort ComputeCrc(ushort crc, byte data)
{
for(inti= 0; i<8; i++{
if((((crc & 0x8000)>>8)^(data &0x80))!=0)
{
//shift left once crc^=Polynome; //XOR with polynomial
}
else
//next packetData reg bit
}
return crc;
}
public ushort ComputeCrc(byte[] packet)
{ 
ushort crc = 0x1D0F; 
for(int i=0; i<packet.Length; i++)
{
crc = ComputeCrc(crc, packet[i]);
}
return (ushort)(~crc);
}
```
# <span id="page-132-0"></span>**APPENDIX C: REVISION HISTORY**

# **Revision A (January 2010)**

This is the initial version of this document.

# **Revision B (June 2010)**

Updates have been incorporated throughout the document, which required extensive revisions to all chapters.

This version also includes minor typographical and formatting changes throughout the data sheet text.

## **Revision C (November 2011)**

Updates have been incorporated throughout the document, which required extensive revisions to all chapters.

Added **[Appendix B: "CRC Computation in C#](#page-131-0) [\(convertible to c\)"](#page-131-0)**.

# **MRF89XA**

**NOTES:**

# <span id="page-134-2"></span>**THE MICROCHIP WEB SITE**

[Microchip provides online support via our WWW site at](http://www.microchip.com) www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

# <span id="page-134-0"></span>**CUSTOMER CHANGE NOTIFICATION SERVICE**

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

[To register, access the Microchip web site at](http://www.microchip.com) www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

# <span id="page-134-1"></span>**CUSTOMER SUPPORT**

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**[Technical support is available through the web site](http://www.microchip.com) [at:](http://www.microchip.com) http://microchip.com/support**

# <span id="page-135-0"></span>**READER RESPONSE**

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.
