SKY12347-362LF: DC-3.0 GHz Six-Bit Digital Attenuator with Serial or Parallel Driver (0.5 dB LSB)

Applications

- Cellular, 3G/4G, WiMAX, and LTE Infrastructures

Features

- Broadband operation: DC to 3.0 GHz
- Attenuation: 31.5 dB with 0.5 dB LSB
- TTL/CMOS-compatible serial, parallel, or latched parallel control interface
- Single supply voltage: +3.3 or +5 V
- Small, QFN (24-pin, 4 x 4 mm) package (MSL1, 260 °C per JEDEC J-STD-020)

Skyworks Green™ products are compliant with all applicable legislation and are halogen-free. For additional information, refer to *Skyworks Definition of Green™*, document number SQ04-0074.

Description

The SKY12347-362LF is a GaAs pHEMT six-bit broadband digital attenuator with a 0.5 dB Least Significant Bit (LSB). A Transistor-to-Transistor Logic (TTL)/CMOS-compatible, dual-mode serial or parallel interface controller is integrated into the device.

The attenuator features low insertion loss, excellent attenuation accuracy, a 31.5 dB attenuation range, and high linearity performance. The SKY12347-362LF is an ideal choice for a wide variety of cellular 3G and 4G infrastructure applications.

Figure 1. SKY12347-362LF Block Diagram

Attenuation is controlled by a Serial Peripheral Interface (SPI). Depending on the SPI sequence applied to the SDI pin, the attenuation state between the RF1 and RF2 pins can vary between a low insertion loss state or up to 31.5 dB. The D0 through D5 DC control pins determine the attenuation state if parallel mode is enabled.

The device is provided in a 4 x 4 mm, 24-pin Quad Flat No-Lead (QFN) package. A functional block diagram is shown in Figure 1. The pin configuration and package are shown in Figure 2. Signal pin assignments and functional pin descriptions are provided in Table 1.

Functional Description

The SKY12347-362LF is a six bit digital attenuator comprised of a GaAs attenuator and a silicon CMOS driver. The attenuation setting is controlled by an SPI. Attenuation is set by a stream of data that is clocked into the shift registers of the silicon chip by the clock signal. To set the attenuation state, a latch signal is sent to the appropriate pin to send the correct bias voltages to the GaAs attenuator.

More than one attenuator can be cascaded together and the data may be passed through one device to the other using the SDO signal (pin 15). The DC bias voltage to the silicon CMOS chip is applied to pin 18 (VDD).

Power-Up/Power-Down Timing

Serial input data (SDI pin) is shifted into the register on the rising edge of the clock (CLK pin), Least Significant Bit (LSB) first. The attenuator changes states on the rising edge of the latch enable (LE pin) signal, according to the most recent six bits of shifted data accepted since the previous falling edge of the latch enable signal. The serial data output is the serial input data delayed by six clock cycles.

Refer to the timing diagram in Figure 3 and timing parameter specifications in Table 2. Table 3 shows the transition states based on the LE and CLK signals.

Power-up sequence is as follows:

0. Connect ground
1. Apply V_{DD}
2. Set all inputs (CLK, SDI, LE)

The power-down sequence is the reverse of above.

Figure 4 shows an example of how to set the attenuator to the 0.5 dB state. The progression of the bit states vs the clock signal is shown. The timing diagram shows that when the latch enable signal goes high, the voltages D0 to D5 set the attenuator to the 0.5 dB state.

Electrical and Mechanical Specifications

The absolute maximum ratings of the SKY12347-362LF are provided in Table 4. Electrical specifications are provided in Tables 5 and 6.

Typical performance characteristics of the SKY12347-362LF are illustrated in Figures 5 through 11.

The state of the SKY12347-362LF is determined by the logic provided in Table 7.

Note: Exposure to maximum rating conditions for extended periods may reduce device reliability. There is no damage to device with only one parameter set at the limit and all other parameters set at or below their nominal value. Exceeding any of the limits listed here may result in permanent damage to the device.

CAUTION: Although this device is designed to be as robust as possible, Electrostatic Discharge (ESD) can damage this device. This device must be protected at all times from ESD. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD precautions should be used at all times.

Evaluation Board Description

The SKY12347-362LF Evaluation Board is used to test the performance of the SKY12347-362LF digital attenuator. An assembly drawing for the Evaluation Board is shown in Figure 14 and an Evaluation Board schematic diagram is shown in Figure 15.

Package Dimensions

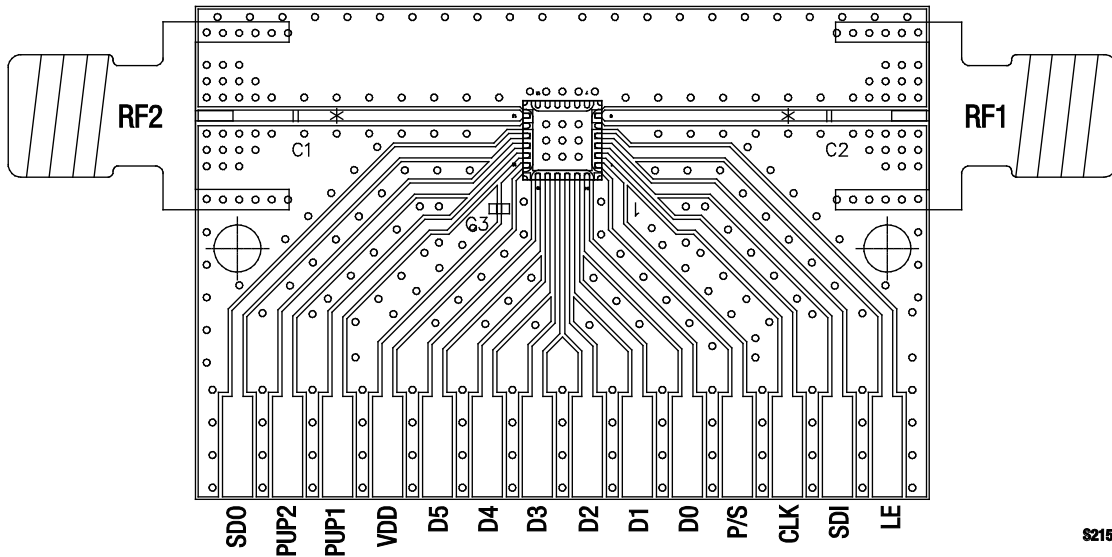

The PCB layout footprint for the SKY12347-362LF is shown in Figure 16. Typical case markings are noted in Figure 17. Package dimensions for the 24-pin QFN are shown in Figure 18, and tape and reel dimensions are provided in Figure 19.

Package and Handling Information

Instructions on the shipping container label regarding exposure to moisture after the container seal is broken must be followed. Otherwise, problems related to moisture absorption may occur when the part is subjected to high temperature during solder assembly.

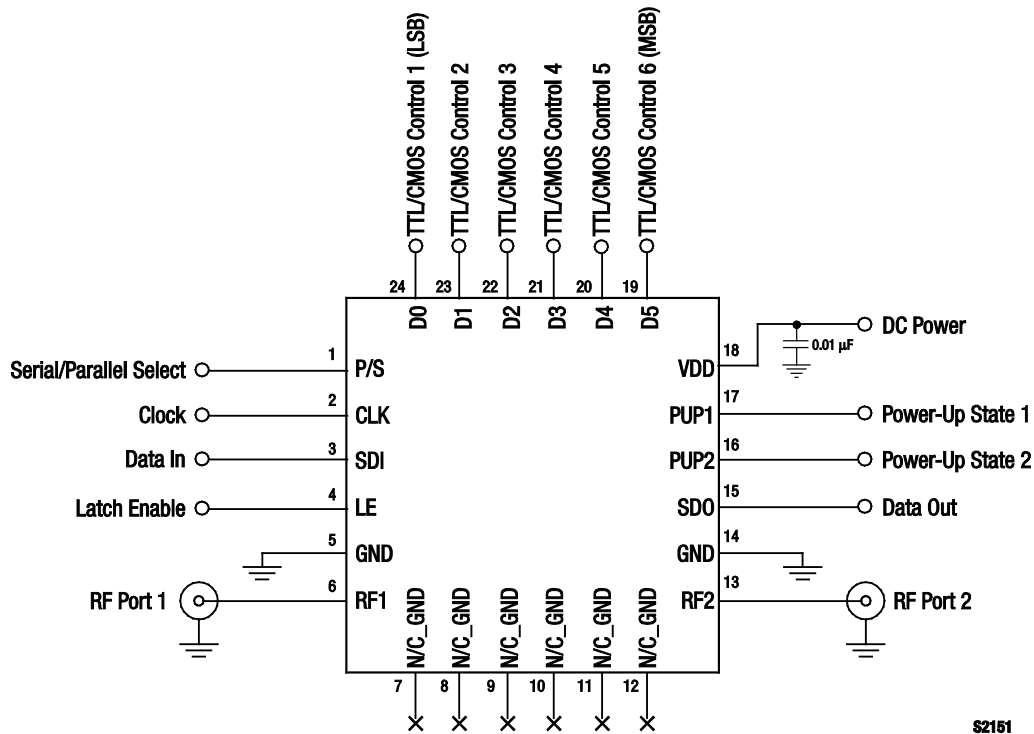

THE SKY12347-362LF is rated to Moisture Sensitivity Level 1 (MSL1) at 260 °C. It can be used for lead or lead-free soldering. For additional information, refer to the Skyworks Application Note, *Solder Reflow Information*, document number 200164.

Care must be taken when attaching this product, whether it is done manually or in a production solder reflow environment. Production quantities of this product are shipped in a standard tape and reel format.
