

Intellimod™ Module Dual-In-Line Intelligent Power Module 30 Amperes/600 Volts

Description:

DIP-IPMs are intelligent power modules that integrate power devices, drivers, and protection circuitry in an ultra compact dual-in-line transfer-mold package for use in driving small three phase motors. Use of 5th generation IGBTs, DIP packaging, and application specific HVICs allow the designer to reduce inverter size and overall design time.

Features:

- Compact Packages
- Single Power Supply
- Integrated HVICs
- Direct Connection to CPU
- Reduced R_{th}

Applications:

- Refrigerators
- Air Conditioners
- Small Servo Motors
- Small Motor Control

Ordering Information:

PS21767 is a 600V, 30 Ampere short pin DIP Intelligent Power Module.

* Short Circuit protection is only for the lower-arms. Please select the external shunt resistance such that the S_C trip level is less than 2.0 times the current rating.

**Fault signal is output when the low-arms short circuit or control supply under-voltage protective function works. The fault output pulse-width, t_{FO} , depends on the capacitance of C_{FO} according to the following approximate equation: $C_{FO} = 12.2 \times 10^{-6} \times t_{FO} [F]$.

*-100 ~ +200 μ m of thermally conductive grease should be applied evenly to the contact surface between the DIP-IPM and heatsink. $R_{th(j-c)}$ is determined by the thickness and the thermal conductivity of the applied grease.

**The input signal with ON pulse less than $P_{WIN(on)}$ may make no response.

***DIP-IPM may make a delayed response (less than about 2 μ sec) or no response for the input signal with OFF pulse width less than $P_{WIN(off)}$. Refer to About Delayed Response Against Shorter Input OFF Signal than $P_{WIN(off)}$ (P-side Only) and Recommended Wiring Around the Shunt Resistor for details about N-line inductance.

Delayed Response Against Shorter Input OFF Signal than $P_{WIN(off)}$ (P-side Only)

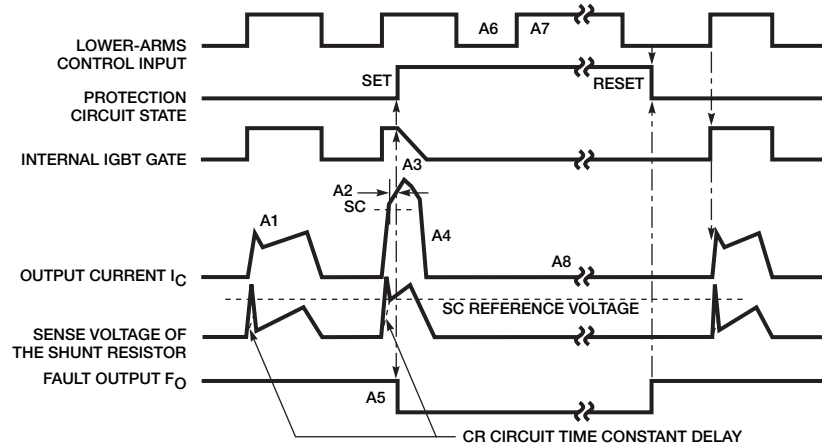

Solid Line – OFF Pulse Width > $P_{WIN(off)}$: Turn ON time t_1 .

Dotted Line – OFF Pulse Width < $P_{WIN(off)}$: Turn ON time t_2 .

Short Circuit Protection (Lower-arms Only with External Shunt Resistor and RC Filter)

- A1: Normal operation – IGBT ON and carrying current.
- A2: Short Circuit current detection (SC trigger).
- A3: IGBT gate hard interruption.
- A4: IGBT turns OFF.
- A5: F_O timer operation starts. The pulse width of the F_O signal is set by the external capacitor C_{FO} .
- A6: Input "L" – IGBT OFF.
- A7: Input "H"
- A8: IGBT OFF state in spite of input "H".

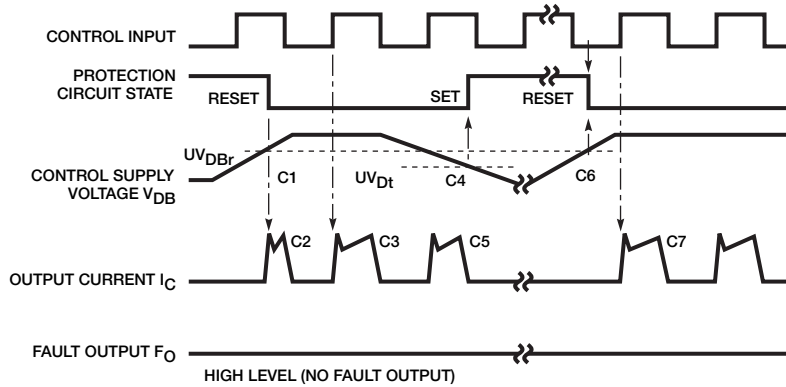

Under-Voltage Protection (Lower-arm, UV_D)

- B1: Control supply voltage rising – After the voltage level reaches UV_{Dr} , the drive circuit begins to work at the rising edge of the next input signal.
- B2: Normal operation – IGBT ON and conducting current.
- B3: Under-voltage trip (UV_{Dt}).
- B4: IGBT turns OFF regardless of the control input level.
- B5: F_O operation starts.
- B6: Under-voltage reset (UV_{Dr}).
- B7: Normal operation – IGBT ON and conducting current.

Under-Voltage Protection (Upper-arm, UV_{DB})

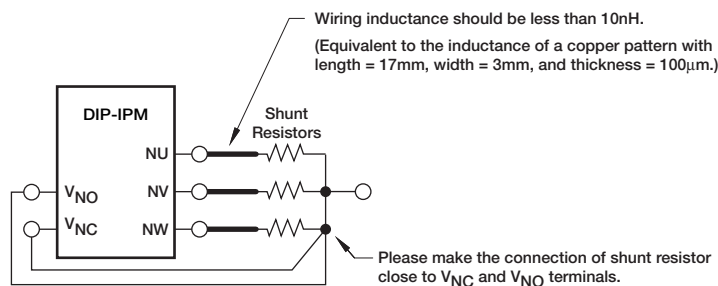

- C1: Control supply voltage rises – After the voltage level reaches UV_{DBr}, the drive circuit begins to work at the rising edge of the next input signal.
- C2: Protection circuit state reset – IGBT ON and conducting current.
- C3: Normal operation – IGBT ON and conducting current.
- C4: Under-voltage trip (UV_{DBt}).
- C5: IGBT OFF regardless of the control input level, but there is no F_O signal output.
- C6: Under-voltage reset (UV_{Dt}).
- C7: Normal operation – IGBT ON and conducting current.

Recommended MCU I/O Interface Circuit

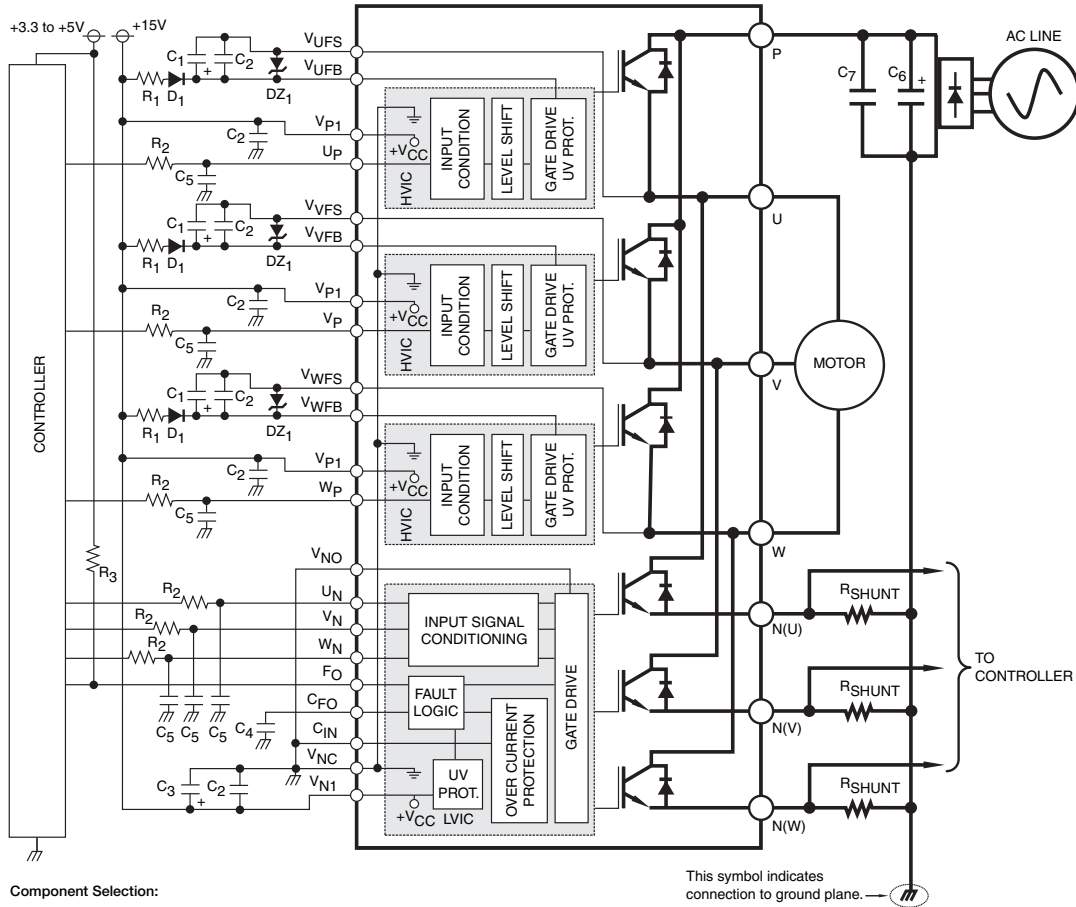

NOTE: RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and the wiring impedance of the printed circuit board. The DIP-IPM input signal section integrates a 2.5kΩ (min) pull-down resistor. Therefore, when using an external filtering resistor, care must be taken to satisfy the turn-on threshold voltage requirement.

Application Circuit

Component Selection:

Dsgn.	Typ. Value	Description
D1	1A, 600V	Boot strap supply diode – Ultra fast recovery
DZ1	16V, 0.25W	Control and boot strap supply over voltage suppression
C1	10-100uF, 50V	Boot strap supply reservoir – Electrolytic, long life, low Impedance, 105°C (Note 5)
C2	0.22-2.0uF, 50V	Local decoupling/High frequency noise filters – Multilayer ceramic (Note 5)
C3	10-100uF, 50V	Control power supply filter – Electrolytic, long life, low Impedance, 105°C (Note 5)
C4	22nF, 50V	Fault output timer capacitor
C5	100pF, 50V	Optional Input signal noise filter – Multilayer ceramic (Note 1)
C6	200-2000uF, 450V	Main DC bus filter capacitor – Electrolytic, long life, high ripple current, 105°C
C7	0.1-0.22uF, 450V	Surge voltage suppression capacitor – Polyester/Polypropylene film (Note 8)
RSHUNT	5-100mohm	Current sensing resistor – Non-inductive, temperature stable, tight tolerance (Note 9)
R1	10 ohm	Boot strap supply inrush limiting resistor
R2	330 ohm	Optional control input noise filter (Note 1, Note 2)
R3	10k ohm	Fault output signal pull-up resistor (Note 3)

Notes:

- Input drive is active-high type. There is a 2.5kΩ(min.) pull-down resistor integrated in the IC input circuit. To prevent malfunction, the wiring of each input should be as short as possible. When using RC coupling circuit, make sure the input signal level meets the turn-on and turn-off threshold voltage. See application notes for details.
- Internal HVIC provides high voltage level shifting allowing direct connection of all six driving signals to the controller.
- FO output is an open collector type. Pull up resistor (R3) should be adjusted to current sink capability of the controller.
- To prevent input signal oscillations, minimize wire length to controller (~2cm). Additional RC filtering (C5 etc.) may be required. If filtering is added be careful to maintain proper dead time and voltage levels. See application notes for details.
- All capacitors should be mounted as close to the terminals as possible. (C1: good temperature, frequency characteristic electrolytic type, and C2, C3: good temperature, frequency and DC bias characteristic ceramic type are recommended.)
- Shows short circuit protection disabled. See application notes for use of short circuit protection.
- Local decoupling frequency filter capacitors must be connected as close as possible to the module's pins.
- The length of the DC link wiring between C5, C6, the DIP's P terminal and the shunt must be minimized to prevent excessive transient voltages. In particular C6 should be mounted as close to the DIP as possible.
- Use high quality, tight tolerance current sensing resistor. Connect resistor as close as possible to the DIP's N terminal. Be careful to check for proper power rating. See application notes for calculation of resistance value.
- Inserting a Zener diode (24V/1W) between each pair of control supply terminals to prevent surge destruction is recommended.
