

HVIC High Voltage Half-Bridge Driver 600 Volts/±500mA

Description:
M81713FP is a high voltage Power MOSFET and IGBT driver for half-bridge applications.

- Features:**
- Shoot Through Interlock
 - Output Current ±500mA
 - Half-Bridge Driver
 - SOP-8 Package
 - Internal Dead Time - Fixed

- Applications:**
- HID Ballast
 - PDP
 - MOSFET Driver
 - IGBT Driver
 - Inverter Module Control

Ordering Information:
M81713FP is a ±500mA, 600 Volt HVIC, High Voltage Half-Bridge Driver

1. Input/Output Logic

HO has positive logic with reference to IN. LO has negative logic with reference to IN.

2. Logic During UV (V_{CC} , V_{BS}) Error

Error Signal	HO	LO
UV Error (V_{CC})*	HO outputs “L” level as long as UV error for V_{CC} is detected. HO responds to IN if V_{CC} exceeds V_{CC} UV reset level.	LO is locked at “L” as long as UV error for V_{CC} is detected. After V_{CC} exceeds V_{CC} UV reset level, the lock for LO is removed and responds to IN signal.
UV Error (V_{BS})	HO is locked at “L” as long as UV error for V_{BS} is detected. After V_{BS} exceeds V_{BS} UV reset level, the lock for HO is removed following an “L” state of the IN signal, and then HO responds to the input.	LO is independent of V_{BS} to respond to IN.

*If UV error for V_{CC} is detected when HO is in “H” level and the falling speed for V_{CC} exceeds $0.03\text{V}/\mu\text{s}$, the OFF signal for HO might not be transmitted from low side to high side and then HO stays “H”.

3. Allowable Supply Voltage Transient

It is recommended supplying V_{CC} first and V_{BS} second. In the case of shutting off supply voltage, it is recommended to shut off V_{BS} first and V_{CC} second. At the time of starting, V_{CC} and V_{BS} , the power supply should be increased slowly (below $50\text{V}/\mu\text{s}$). If it is increased rapidly, output signal (HO or LO) may be “H”.
