Dec-2012

### Product Description

The KXTJ9 is a tri-axis +/-2g, +/-4g or +/-8g silicon micromachined accelerometer. The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. Acceleration sensing is based on the principle of a differential capacitance arising from acceleration-induced motion of the sense element, which further utilizes common mode cancellation to decrease errors from process variation, temperature, and environmental stress. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit. A separate ASIC device packaged with the sense element provides signal conditioning and digital communications. The accelerometer is delivered in a 3 x 3 x 0.9 mm LGA plastic package operating from a 1.8 – 3.6V DC supply. Voltage regulators are used to maintain constant internal operating voltages over the range of input supply voltages. This results in stable operating characteristics over the range of input supply voltages and virtually undetectable ratiometric error. The I<sup>2</sup>C digital protocol is used to communicate with the chip to configure the part and monitor outputs.

This product conforms to Directive 2002/95/EC of the European Parliament and of the Council of the European Union (RoHS). Specifically, this product does not contain lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB), or polybrominated diphenyl ethers (PBDE) above the maximum concentration values (MCV) by weight in any of its homogenous materials. Homogenous materials are "of uniform composition throughout."

This product is halogen-free per IEC 61249-2-21. Specifically, the materials used in this product contain a maximum total halogen content of 1500 ppm with less than 900-ppm bromine and less than 900-ppm chlorine.

### Soldering

Soldering recommendations are available upon request or from [www.kionix.com](http://www.kionix.com).

### Floor Life

Factory floor life exposure of the KXCJ9 reels removed from the moisture barrier bag should not exceed a maximum of 168 hours at 30C/60%RH. If this floor life is exceeded, the parts should be dried per the IPC/JEDEC J-STD-033A standard.

## KXTJ9 Digital Interface

The Kionix KXTJ9 digital accelerometer has the ability to communicate on the I<sup>2</sup>C digital serial interface bus. This allows for easy system integration by eliminating analog-to-digital converter requirements and by providing direct communication with system micro-controllers.

The serial interface terms and descriptions as indicated in Table 8 below will be observed throughout this document.

Term	Description
Transmitter	The device that transmits data to the bus.
Receiver	The device that receives data from the bus.
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer.
Slave	The device addressed by the Master.

**Table 8.** Serial Interface Terminologies

## I<sup>2</sup>C Serial Interface

As previously mentioned, the KXTJ9 has the ability to communicate on an I<sup>2</sup>C bus. I<sup>2</sup>C is primarily used for synchronous serial communication between a Master device and one or more Slave devices. The Master, typically a micro controller, provides the serial clock signal and addresses Slave devices on the bus. The KXTJ9 always operates as a Slave device during standard Master-Slave I<sup>2</sup>C operation.

I<sup>2</sup>C is a two-wire serial interface that contains a Serial Clock (SCL) line and a Serial Data (SDA) line. SCL is a serial clock that is provided by the Master, but can be held low by any Slave device, putting the Master into a wait condition. SDA is a bi-directional line used to transmit and receive data to and from the interface. Data is transmitted MSB (Most Significant Bit) first in 8-bit per byte format, and the number of bytes transmitted per transfer is unlimited. The I<sup>2</sup>C bus is considered free when both lines are high. The I<sup>2</sup>C interface is compliant with high-speed mode, fast mode and standard mode I<sup>2</sup>C standards.

PART NUMBER:

KXTJ9-1007  
Rev. 4  
Dec-2012

Figure 1. Multiple KXTJ9 I<sup>2</sup>C Connection

## I<sup>2</sup>C Operation

Transactions on the I<sup>2</sup>C bus begin after the Master transmits a start condition (S), which is defined as a high-to-low transition on the data line while the SCL line is held high. The bus is considered busy after this condition. The next byte of data transmitted after the start condition contains the Slave Address (SAD) in the seven MSBs (Most Significant Bits), and the LSB (Least Significant Bit) tells whether the Master will be receiving data '1' from the Slave or transmitting data '0' to the Slave. When a Slave Address is sent, each device on the bus compares the seven MSBs with its internally stored address. If they match, the device considers itself addressed by the Master. The KXTJ9's Slave Address is comprised of a programmable part and a fixed part, which allows for connection of multiple KXTJ9's to the same I<sup>2</sup>C bus. The Slave Address associated with the KXTJ9 is 000111X, where the programmable bit, X, is determined by the assignment of ADDR (pin 8) to GND or IO\_Vdd. Figure 1. Multiple KXTJ9 I<sup>2</sup>C Connection above shows how two KXTJ9's would be implemented on an I<sup>2</sup>C bus.

It is mandatory that receiving devices acknowledge (ACK) each transaction. Therefore, the transmitter must release the SDA line during this ACK pulse. The receiver then pulls the data line low so that it remains stable low during the high period of the ACK clock pulse. A receiver that has been addressed, whether it is Master or Slave, is obliged to generate an ACK after each byte of data has been received. To conclude a transaction, the Master must transmit a stop condition (P) by transitioning the SDA line from low to high while SCL is high. The I<sup>2</sup>C bus is now free.

	<b>± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KXTJ9-1007</b> <b>Rev. 4</b> <b>Dec-2012</b>
---	---	--

### Writing to a KXTJ9 8-bit Register

Upon power up, the Master must write to the KXTJ9's control registers to set its operational mode. Therefore, when writing to a control register on the I<sup>2</sup>C bus, as shown Sequence 1 on the following page, the following protocol must be observed: After a start condition, SAD+W transmission, and the KXTJ9 ACK has been returned, an 8-bit Register Address (RA) command is transmitted by the Master. This command is telling the KXTJ9 to which 8-bit register the Master will be writing the data. Since this is I<sup>2</sup>C mode, the MSB of the RA command should always be zero (0). The KXTJ9 acknowledges the RA and the Master transmits the data to be stored in the 8-bit register. The KXTJ9 acknowledges that it has received the data and the Master transmits a stop condition (P) to end the data transfer. The data sent to the KXTJ9 is now stored in the appropriate register. The KXTJ9 automatically increments the received RA commands and, therefore, multiple bytes of data can be written to sequential registers after each Slave ACK as shown in Sequence 2 on the following page.

### Reading from a KXTJ9 8-bit Register

When reading data from a KXTJ9 8-bit register on the I<sup>2</sup>C bus, as shown in Sequence 3 on the next page, the following protocol must be observed: The Master first transmits a start condition (S) and the appropriate Slave Address (SAD) with the LSB set at '0' to write. The KXTJ9 acknowledges and the Master transmits the 8-bit RA of the register it wants to read. The KXTJ9 again acknowledges, and the Master transmits a repeated start condition (Sr). After the repeated start condition, the Master addresses the KXTJ9 with a '1' in the LSB (SAD+R) to read from the previously selected register. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NACK) it received the transmitted data, but transmits a stop condition to end the data transfer. Note that the KXTJ9 automatically increments through its sequential registers, allowing data to be read from multiple registers following a single SAD+R command as shown below in Sequence 4 on the following page. The 8-bit register data is transmitted using a left-most format, first bit shifted/clocked out being the MSB bit.

If a receiver cannot transmit or receive another complete byte of data until it has performed some other function, it can hold SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases SCL.

## Data Transfer Sequences

The following information clearly illustrates the variety of data transfers that can occur on the I<sup>2</sup>C bus and how the Master and Slave interact during these transfers. Table 9 defines the I<sup>2</sup>C terms used during the data transfers.

Term	Definition
S	Start Condition
Sr	Repeated Start Condition
SAD	Slave Address
W	Write Bit
R	Read Bit
ACK	Acknowledge
NACK	Not Acknowledge
RA	Register Address
Data	Transmitted/Received Data
P	Stop Condition

**Table 9.** I<sup>2</sup>C Terms

**Sequence 1.** The Master is writing one byte to the Slave.

Master	S	SAD + W		RA		DATA		P
Slave			ACK		ACK		ACK	

**Sequence 2.** The Master is writing multiple bytes to the Slave.

Master	S	SAD + W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

**Sequence 3.** The Master is receiving one byte of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			NACK	P
Slave			ACK		ACK			ACK	DATA		

**Sequence 4.** The Master is receiving multiple bytes of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA

## KXTJ9 Register Descriptions

### Accelerometer Outputs

These registers contain up to 12-bits of valid acceleration data for each axis depending on the setting of the RES bit in CTRL\_REG1, where the acceleration outputs are represented in 12-bit valid data when RES = '1' and 8-bit valid data when RES = '0'. The data is updated every user-defined ODR period, is protected from overwrite during each read, and can be converted from digital counts to acceleration (g) per Table 11 below. The register acceleration output binary data is represented in 2's complement format. For example, if N = 12 bits, then the Counts range is from -2048 to 2047, and if N = 8 bits, then the Counts range is from -128 to 127.

12-bit Register Data (2's complement)	Equivalent Counts in decimal	Range = +/-2g	Range = +/-4g	Range = +/-8g
0111 1111 1111	2047	+1.999g	+3.998g	+7.996g

## DCST\_RESP

This register can be used to verify proper integrated circuit functionality. It always has a byte value of 0x55h unless the DCST bit in CTRL\_REG3 is set. At that point this value is set to 0xAAh. The byte value is returned to 0x55h after reading this register.

R	R	R	R	R	R	R	R	
DCSTR7	DCSTR6	DCSTR5	DCSTR4	DCSTR3	DCSTR2	DCSTR1	DCSTR0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	01010101
								I <sup>2</sup> C Address: 0x0Ch

## WHO\_AM\_I

This register can be used for supplier recognition, as it can be factory written to a known byte value. The default value is 0x08h.

R	R	R	R	R	R	R	R	
WIA7	WIA6	WIA5	WIA4	WIA3	WIA2	WIA1	WIA0	Reset Value

								I <sup>2</sup> C Address: 0x0Fh

## Interrupt Source Registers

These two registers report interrupt state changes. This data is updated when a new interrupt event occurs and each application's result is latched until the interrupt release register is read. The programmable interrupt engine can be configured to report data in an unlatched manner via the interrupt control registers.

# ± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications

**PART NUMBER:**

**KXTJ9-1007  
Rev. 4  
Dec-2012**

## INT\_SOURCE1

This register reports which function caused an interrupt. Reading from the interrupt release register (INT\_REL, 0x1Ah) will clear the entire contents of this register.

R	R	R	R	R	R	R	R
0	0	0	DRDY	0	0	WUFS	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x16h							

**DRDY** - indicates that new acceleration data (at Reg Addr 0x06h to 0x0Bh) is available. This bit is cleared when acceleration data is read or the interrupt release register (INT\_REL, 0x1Ah) is read.

0 = New acceleration data not available  
1 = New acceleration data available

**WUFS** - Wake up, This bit is cleared when the interrupt source latch register (INT\_REL, 0x1Ah) is read.

0 = No motion  
1 = Motion has activated the interrupt

## INT\_SOURCE2

This register reports the axis and direction of detected motion per Table 12. This register is cleared when the interrupt source latch register (INT\_REL, 0x1Ah) is read.

R	R	R	R	R	R	R	R
0	0	XNWU	XPWU	YNWU	YPWU	ZNWU	ZPWU
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x17h							

Bit	Description
XNWU	X Negative (X-) Reported
XPWU	X Positive (X+) Reported
YNWU	Y Negative (Y-) Reported
YPWU	Y Positive (Y+) Reported
ZNWU	Z Negative (Z-) Reported
ZPWU	Z Positive (Z+) Reported

**Table 12.** KXTJ9 Motion Reporting

Dec-2012**

## STATUS\_REG

This register reports the status of the interrupt.

R	R	R	R	R	R	R	R
0	0	0	INT	0	0	0	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x18h							

**INT** reports the combined (OR) interrupt information of DRDY and WUFS in the interrupt source register (INT\_SOURCE1, 0x16h). This bit is cleared when acceleration data is read or the interrupt release register (INT\_REL, 1Ah) is read.

0 = no interrupt event

1 = interrupt event has occurred

## INT\_REL

Latched interrupt source information (INT\_SOURCE1, 0x16h and INT\_SOURCE2, 0x17h) is cleared and physical interrupt latched pin (7) is changed to its inactive state when this register is read.

R	R	R	R	R	R	R	R
X	X	X	X	X	X	X	X
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I <sup>2</sup> C Address: 0x1Ah

---	---	--

### CTRL\_REG1

Read/write control register that controls the main feature set.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
PC1	RES	DRDYE	GSEL1	GSEL0	0	WUFE	0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I <sup>2</sup> C Address: 0x1Bh								

**PC1** controls the operating mode of the KXTJ9.

- 0 = stand-by mode
- 1 = operating mode

**RES** determines the performance mode of the KXTJ9. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

- 0 = low current, 8-bit valid. Only available for ODR ≤ 200 Hz. Bandwidth (Hz) = 800
- 1 = high current, 12-bit or 14-bit valid. Bandwidth (Hz) = ODR/2

**DRDYE** enables the reporting of the availability of new acceleration data as an interrupt. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

- 0 = availability of new acceleration data is not reflected as an interrupt
- 1 = availability of new acceleration data is reflected as an interrupt

**GSEL1, GSEL0** selects the acceleration range of the accelerometer outputs per Table 13. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

GSEL1	GSEL0	Range
0	0	+/-2g
0	1	+/-4g
1	0	+/-8g
1	1	+/-8g <sup>1</sup>

**Table 13.** Selected Acceleration Range

**WUFE** enables the Wake Up (motion detect) function. 0= disabled, 1= enabled. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

- 0 = Wake Up function disabled

<sup>1</sup> This is a 14-bit mode available only in Full Power mode and only for Registers 0x06h-0x0Bh

	<b>± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KXTJ9-1007</b> <b>Rev. 4</b> <b>Dec-2012</b>
---	---	--

1 = Wake Up function enabled

**CTRL\_REG2**

Read/write control register that provides more feature set control. Note that to properly change the value of this register, the PC1 bit in CTRL\_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
SRST	reserved	reserved	DCST	reserved	OWUFA	OWUFB	OWUFC	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I <sup>2</sup> C Address: 0x1Dh								

**SRST** initiates software reset, which performs the RAM reboot routine. This bit will remain 1 until the RAM reboot routine is finished.

SRST = 0 – no action

SRST = 1 – start RAM reboot routine

**DCST** initiates the digital communication self-test function.

DCST = 0 – no action

DCST = 1 – sets ST\_RESP register to 0xAAh and when ST\_RESP is read, sets this bit to 0 and sets ST\_RESP to 0x55h

**OWUFA, OWUFB, OWUFC** sets the Output Data Rate for the Wake Up function (motion detection) per Table 14 below

OWUFA	OWUFB	OWUFC	Wake Up function Output Data Rate
0	0	0	0.781Hz
0	0	1	1.563Hz
0	1	0	3.125Hz
0	1	1	6.25Hz
1	0	0	12.5Hz
1	0	1	25Hz
1	1	0	50Hz
1	1	1	100Hz

**Table 14.** Output Data Rate for Wake Up Function

# ± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications

**PART NUMBER:**

**KXTJ9-1007**  
**Rev. 4**  
**Dec-2012**

## INT\_CTRL\_REG1

This register controls the settings for the physical interrupt pin (7). Note that to properly change the value of this register, the PC1 bit in CTRL\_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	IEN	IEA	IEL	0	0	0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00010000
I <sup>2</sup> C Address: 0x1Eh								

**IEN** enables/disables the physical interrupt pin (7)

*IEN = 0 – physical interrupt pin (7) is disabled*

*IEN = 1 – physical interrupt pin (7) is enabled*

**IEA** sets the polarity of the physical interrupt pin (7)

*IEA = 0 – polarity of the physical interrupt pin (7) is active low*

*IEA = 1 – polarity of the physical interrupt pin (7) is active high*

**IEL** sets the response of the physical interrupt pin (7)

*IEL = 0 – the physical interrupt pin (7) latches until it is cleared by reading INT\_REL*

*IEL = 1 – the physical interrupt pin (7) will transmit one pulse with a period of 0.03 - 0.05ms*

## INT\_CTRL\_REG2

This register controls which axis and direction of detected motion can cause an interrupt. Note that to properly change the value of this register, the PC1 bit in CTRL\_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	XNWUE	XPWUE	YNWUE	YPWUE	ZNWUE	ZPWUE	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00111111
I <sup>2</sup> C Address: 0x1Fh								

**XNWU** - x negative (x-): 0 = disabled, 1 = enabled

**XPWU** - x positive (x+): 0 = disabled, 1 = enabled

**YNWU** - y negative (y-): 0 = disabled, 1 = enabled

**YPWU** - y positive (y+): 0 = disabled, 1 = enabled

**ZNWU** - z negative (z-): 0 = disabled, 1 = enabled

**ZPWU** - z positive (z+): 0 = disabled, 1 = enabled

	<b>± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KXTJ9-1007</b> <b>Rev. 4</b> <b>Dec-2012</b>
---	---	--

**DATA\_CTRL\_REG**

Read/write control register that configures the acceleration outputs. Note that to properly change the value of this register, the PC1 bit in CTRL\_REG1 must first be set to “0”.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	0	0	OSAA	OSAB	OSAC	OSAD	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000010
I <sup>2</sup> C Address: 0x21h								

**OSAA, OSAB, OSAC, OSAD** sets the output data rate (ODR) for the low-pass filtered acceleration outputs per

Table 15.

OSAA	OSAB	OSAC	OSAD	Output Data Rate	LPF Roll-Off
1	0	0	0	0.781Hz	0.3905Hz
1	0	0	1	1.563Hz	0.781Hz
1	0	1	0	3.125Hz	1.563Hz
1	0	1	1	6.25Hz	3.125Hz
0	0	0	0	12.5Hz	6.25Hz
0	0	0	1	25Hz	12.5Hz
0	0	1	0	50Hz	25Hz
0	0	1	1	100Hz	50Hz
0	1	0	0	200Hz	100Hz
0	1	0	1	400Hz	200Hz
0	1	1	0	800Hz	400Hz
0	1	1	1	1600Hz	800Hz

**Table 15.** Acceleration Output Data Rate (ODR) and LPF Roll-Off

## WAKEUP\_TIMER

This register sets the time motion must be present before a wake-up interrupt is set. Every count is calculated as 1/OWUF delay period. Note that to properly change the value of this register, the PC1 bit in CTRL\_REG1 must first be set to "0". Valid Entries are 1 to 255, zero is excluded.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
WUFC7	WUFC6	WUFC5	WUFC4	WUFC3	WUFC2	WUFC1	WUFC0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I <sup>2</sup> C Address: 0x29h								

## SELF\_TEST

When 0xCA is written to this register, the MEMS self-test function is enabled. Electrostatic-actuation of the accelerometer, results in a DC shift of the X, Y and Z axis outputs. Writing 0x00 to this register will return the accelerometer to normal operation.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
1	1	0	0	1	0	1	0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
I <sup>2</sup> C Address: 0x3Ah								

## WAKEUP\_THRESHOLD

This register sets the threshold for wake-up (motion detect) interrupt is set. The KXTJ9 will ship from the factory with this value set to correspond to a change in acceleration of 0.5g. Note that to properly change the value of this register, the PC1 bit in CTRL\_REG1 must first be set to "0".

---	---	--

### KXTJ9 Embedded Wake Up Function

The KXTJ9 contains an interrupt engine that can be configured by the user to report when qualified changes in acceleration occur. The user has the option to enable or disable specific axes and specific directions, as well as to specify the delay time. An example use case for the engine would be to detect motion on any axis to signal an event and wake up the accelerometer or other devices. This can be achieved by configuring the engine to detect when the acceleration on any axis is greater than the user-defined threshold for a user-defined amount of time. Equations 1 and 2 show how to calculate the engine threshold (WAKEUP\_THRESHOLD) and delay time (WAKEUP\_TIMER) register values for the desired result.

$$WAKEUP\_THRESHOLD \text{ (counts)} = \text{Desired Threshold (g)} \times 16 \text{ (counts/g)}$$

**Equation 1.** Wake Up Threshold

$$WAKEUP\_TIMER \text{ (counts)} = \text{Desired Delay Time (sec)} \times OWUF \text{ (Hz)}$$

**Equation 2.** Wake Up Delay Time

	<b>± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications</b>	<b>PART NUMBER:</b> <b>KXTJ9-1007</b> <b>Rev. 4</b> <b>Dec-2012</b>
---	---	--

Figure 2 below shows the latched response of the Wake Up Function with WUF Timer = 10 counts.

### Typical Wake Up Interrupt Example

**Figure 2.** Latched Motion Interrupt Response

The KXTJ9-1007 wake-up function is always latched. However, if the INT\_CTRL\_REG1 is set with IEL = 1, then upon a wake-up event the WUF interrupt signal will pulse and return low, but only once. The WUF interrupt output will not reset until a read of the INT\_REL latch reset register.
