

POWER SUPPLY

- 3AC 380-480V Wide-range Input
- 2-Phase Operation also Possible
- Efficiency up to 95%
- Width only 65mm
- 150% Peak Load Capability
- Active Power Factor Correction PFC
- Active Input Transient Filter
- Full Power Between -25°C and +60°C
- Minimal Inrush Current
- DC-OK Relay Contact
- Quick-connect Spring Clamp Terminals
- 3 Year Warranty

1. GENERAL DESCRIPTION

The most outstanding features of this Dimension Q-Series DIN-rail power supply are the high efficiency and the small size, which are achieved by a synchronous rectification and further novel design details.

Large power reserves of 150% support the starting of heavy loads such as DC motors or capacitive loads. In many cases this allows the use of a unit from a lower wattage class which saves space and money.

High immunity to transients and power surges as well as low electromagnetic emission makes usage in nearly every environment possible.

The integrated output power manager and virtually no input inrush current make installation and usage simple with no jumpers and switches necessary. Diagnostics are easy due to the dry DC-ok contact, a green DC-ok LED and red overload LED.

Unique quick-connect spring-clamp terminals allow a safe and fast installation and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

2. SHORT-FORM DATA

Output voltage	DC 24V	
Adjustment range	24-28V	
Output current	20A	Continuous, 24V
	30A	For typ. 4s, 24V
Output power	480W	Continuous, 24V
	720W	For typ. 4s, 24V
Output ripple	< 100mVpp	20Hz to 20MHz
Input voltage	AC 380-480V	±15%
Mains frequency	50-60Hz	±6%
AC Input current	0.79 / 0.65A	At 3x400 / 480Vac
Power factor	0.94 / 0.95	At 3x400 / 480Vac
AC Inrush current	typ. 3A peak	
Efficiency	95.0 / 94.8%	At 3x400 / 480Vac
Losses	25.3 / 26.4W	At 3x400 / 480Vac
Temperature range	-25°C to +70°C	Operational
Derating	12W/°C	+60 to +70°C
Hold-up time	typ. 22 / 22ms	At 3x400 / 480Vac
Dimensions	65x124x127mm	WxHxD

INTENDED USE

The power supply shall only be installed and put into operation by qualified personnel.

This power supply is designed for installation in an enclosure and is intended for the general use, such as in industrial control, office, communication, and instrumentation equipment. Do not use this device in aircraft, trains and nuclear equipment, where malfunctioning of the power supply may cause severe personal injury or threaten human life.

TERMINOLOGY AND ABBREVIATIONS

PE and  symbol	PE is the abbreviation for Protective Earth and has the same meaning as the symbol  .
Earth, Ground	This document uses the term "earth" which is the same as the U.S. term "ground".
T.b.d.	To be defined, value or description will follow later.
AC 400V	A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually $\pm 15\%$) included. E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V) As long as not otherwise stated, AC 380V and AC 400V parameters are valid at 50Hz and AC 480V parameters are valid at 60Hz mains frequency.
400Vac	A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.

DISCLAIMER

The information presented in this document is believed to be accurate and reliable and may change without notice.

5. AC-INPUT

AC input	nom.	3AC 380-480V	Wide-range input, TN-, TT-, IT-Mains, see Fig. 5-1 Consult factory if one phase is earthed.	
AC input range	min.	3x 323-552Vac	Continuous operation	
	min.	3x 280-323Vac	Full power for 200ms, no damage between 0 and 280Vac For 2-phase operation see section 27.7	
Input frequency	nom.	50–60Hz	±6%	
Turn-on voltage	typ.	3x 263Vac	Steady-state value, see Fig. 5-1	
Shut-down voltage	typ.	3x 242Vac	Steady-state value, see Fig. 5-1	
		3AC 400V	3AC 480V	
Input current	typ.	0.79A	0.65A	At 24V, 20A, all three phases equal voltage See Fig. 5-3
Power factor *)	typ.	0.94	0.95	At 24V, 20A, see Fig. 5-4
Start-up delay	typ.	350ms	290ms	See Fig. 5-2
Rise time	typ.	30ms	30ms	0mF, 24V, 20A, see Fig. 5-2
	typ.	40ms	40ms	20mF, 24V, 20A, see Fig. 5-2
Turn-on overshoot	max.	500mV	500mV	See Fig. 5-2

*) The power factor is the ratio of the true (or real) power to the apparent power in an AC circuit.

Fig. 5-1 Input voltage range

Fig. 5-2 Turn-on behavior, definitions

Fig. 5-3 Input current vs. output load at 24V

Fig. 5-4 Power factor vs. output load

6. DC-INPUT

The QT20 series shall not be used with a DC-input voltage without consulting PULS.
 Check QTD20.241 for DC-input voltage. (special version for intermediate bus systems, drive systems)

7. INPUT INRUSH CURRENT

An active inrush limitation circuitry limits the input inrush current after turn-on of the input voltage and after short input voltage interruptions.
 The charging current into EMI suppression capacitors is disregarded in the first milliseconds after switch-on.

		3AC 400V	3AC 480V	
Inrush current	max.	10A _{peak}	10A _{peak}	-25°C to +70°C
	typ.	3A _{peak}	3A _{peak}	-25°C to +70°C
Inrush energy	max.	1A ² s	1A ² s	-25°C to +70°C
Inrush delay	typ.	270ms	220ms	

Fig. 7-1 Input inrush current, typical behavior

- A:** Inrush delay
- B:** Start-up delay
- Input: 3x400Vac
- Output: 24V, 20A
- Ambient: 25°C
- Upper curve: Input current 2A / DIV
- Medium curve: Input voltage 1000V / DIV
- Lower curve: Output voltage 50V / DIV
- Time basis: 100ms / DIV

8. OUTPUT

Output voltage	nom.	24V	
Adjustment range	min.	24-28V	Guaranteed, multi turn potentiometer
	max.	30V	At clockwise end position of potentiometer
Factory setting		24.1V	±0.2%, at full load, cold unit
Line regulation	max.	10mV	320 to 552Vac
Load regulation	max.	100mV	Static value, 0A → 20A → 0A
Ripple and noise voltage	max.	100mVpp	20Hz to 20MHz, 50Ohm
Output capacitance	typ.	950µF	The energy of the bulk capacitor on the input side will be transferred to the output to supply short load peaks.

Continuous power capability

Output current	nom.	20A	At 24V, see Fig. 8-1
	nom.	17.5A	At 28V, see Fig. 8-1
Output power	nom.	480W	24V, continuous
	nom.	490W	28V, continuous
Short-circuit current	min.	20A	Load impedance 50mOhm, see Fig. 8-1
	max.	23A	Load impedance 50mOhm, see Fig. 8-1

BonusPower[®], short term power capability (up to typ. 4s)

The power supply is designed to support loads with a higher short-term power requirement without damage or shutdown. The short-term duration is hardware controlled by an output power manager. The BonusPower[®] is repeatedly available. Detailed information can be found in chapter 27.1 .

Once BonusPower[®] has been stopped by the output power limiter, a timer disables the next BonusPower[®] capability. The recovery timer will start as soon as the output voltage reaches the adjusted value again, which usually happens after the load has been reduced.

Output current	nom.	30A	At 24V, see Fig. 8-1
	nom.	26A	At 28V, see Fig. 8-1
Output power	nom.	720W	24V, short term
	nom.	728W	28V, short term
Short-circuit current	min.	30A	Load impedance 50mOhm, see Fig. 8-1
	max.	34A	Load impedance 50mOhm, see Fig. 8-1
Bonus time	typ.	4s	At 24V, 30A, duration until the output voltage dips,
	min.	3.5s	See Fig. 8-2
	max.	4.5s	
BonusPower [®] recovery time	typ.	7s	Overload free time to reset power manager, see Fig. 8-3

Peak current capability (up to several ms)

The power supply can deliver a peak current which is higher than the specified short-term current. This helps to start current demanding loads or to safely operate subsequent circuit breakers.

The extra current is supplied by the output capacitors inside the power supply. During this event, the capacitors will be discharged and causes a voltage dip on the output. Detailed curves can be found in chapter 27.2.

Peak current voltage dips	typ.	from 24V to 16V	At 40A for 50ms
	typ.	from 24V to 19V	At 80A for 2ms
	typ.	from 24V to 16.5V	At 80A for 5ms

Fig. 8-1 **Output voltage vs. output current, typ.**

Fig. 8-2 **Bonus time vs. output power**

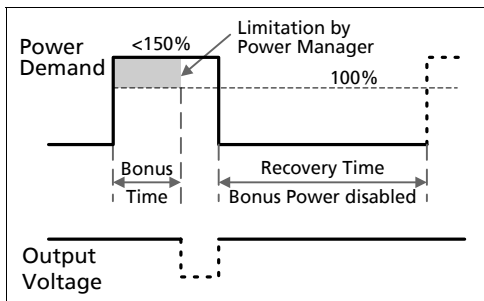

Fig. 8-3 **BonusPower® recovery time**

Bonus Power® is available as soon as power comes on and immediately after the end of an output short circuit.

Fig. 8-4 **BonusPower® after input turn-on**

Fig. 8-5 **BonusPower® after output short**

9. HOLD-UP TIME

		3AC 400V	3AC 480V	
Hold-up Time	typ.	22ms	22ms	20A, 24V, see Fig. 9-1
	typ.	44ms	44ms	10A, 24V, see Fig. 9-1

Fig. 9-1 **Hold-up time vs. input voltage**

Fig. 9-2 **Shut-down behavior, definitions**

10. DC-OK RELAY CONTACT

This feature monitors the output voltage, which is produced by the power supply itself. It is independent of a backed voltage from a unit which is connected in parallel to the power supply output.

Contact closes	As soon as the output voltage reaches the adjusted output voltage.		
Contact opens	As soon as the output voltage dips more than 10% below the adjusted output voltage. Short dips will be extended to a signal length of 250ms. Dips shorter than 1ms will be ignored.		
Contact re-closes	As soon as the output voltage exceeds 90% of the adjusted voltage.		
Contact ratings	max	60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A	resistive load
	min	1mA at 5Vdc	min. permissible load
Isolation voltage	See dielectric strength table in section 20		

Fig. 10-1 **DC-ok relay contact behavior**

Note:

The DC-ok feature requires that the output voltage reaches the nominal (=adjusted) level after turn-on in order to function according to specification. If this level cannot be achieved, the overload lamp will be on and the DC-ok contact will be open. The overload signal will only shut off as soon as the adjusted voltage is reached. This is an important condition to consider particularly, if the load is a battery, the power supply is used in parallel or the power supply is used for N+1 redundant systems.

11. EFFICIENCY AND POWER LOSSES

		3AC 400V	3AC 480V	
Efficiency	typ.	95.0%	94.8%	20A, 24V
Power losses	typ.	25.3W	26.3W	20A, 24V
	typ.	8.2W	10.0W	0A

14. TERMINALS AND WIRING

Type	Bi-stable, quick-connect spring clamp terminals. IP20 Finger safe construction. Suitable for field- and factory installation. Shipped in open position.
Solid wire	0.5-6mm ²
Stranded wire	0.5-4mm ²
American wire gauge	20-10 AWG
Ferrules	Allowed, but not required
Wire stripping length	10mm / 0.4inch
Pull-out force	10AWG:80N, 12AWG:60N, 14AWG:50N, 16AWG:40N (according to UL486E)

Fig. 14-1 Connecting a wire

Instructions:

- a) Use appropriate copper cables that are designed for an operating temperature of: 60°C for ambient up to 45°C and 75°C for ambient up to 60°C minimum.
- b) Follow national installation codes and installation regulations!
- c) Ensure that all strands of a stranded wire enter the terminal connection!
- d) Up to two stranded wires with the same cross section are permitted in one connection point (except PE wire).
- e) Do not use the unit without PE connection.

15. RELIABILITY

		3AC 400V	3AC 480V	
Lifetime expectancy	min.	51 000h	48 000h	40°C, 24V, 20A
	min.	89 000h	86 000h	40°C, 24V, 10A
	min.	144 000h	135 000h	25°C, 24V, 20A
MTBF SN 29500, IEC 61709		690 000h	670 000h	40°C, 24V, 20A
		1 194 000h	1 159 000h	25°C, 24V, 20A
MTBF MIL HDBK 217F		284 000h	271 000h	40°C, 24V, 20A, Ground Benign GB40
		389 000h	371 000h	25°C, 24V, 20A, Ground Benign GB25

The **Lifetime expectancy** shown in the table indicates the operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors.

Lifetime expectancy is specified in operational hours. Lifetime expectancy is calculated according to the capacitor's manufacturer specification. The prediction model allows a calculation of up to 15 years from date of shipment.

MTBF stands for **Mean Time Between Failure**, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.

16. EMC

The power supply is suitable for applications in industrial environment as well as in residential, commercial and light industry environment without any restrictions. CE mark is in conformance with EMC guideline 89/336/EEC and 93/68/EEC and the low-voltage directive (LVD) 73/23/EWG. A detailed EMC Report is available upon request

EMC Immunity	EN 61000-6-1 EN 61000-6-2		Generic standards	
Electrostatic discharge	EN 61000-4-2	Contact discharge	8kV	Criterion A
		Air discharge	15kV	Criterion A
Electromagnetic RF field	EN 61000-4-3	80MHz-1GHz	10V/m	Criterion A
Fast transients (Burst)	EN 61000-4-4	Input lines	4kV	Criterion A
		Output lines	2kV	Criterion A
Surge voltage on input	EN 61000-4-5	L1 → L2, L2 → L3, L1 → L3	2kV	Criterion A
Surge voltage on input	EN 61000-4-5	L1 / L2 / L3 → PE	4kV	Criterion A
Surge voltage on output	EN 61000-4-5	+ → -	500V	Criterion A
		+ / - → PE	500V	Criterion A
Conducted disturbance	EN 61000-4-6	0.15-80MHz	10V	Criterion A
Mains voltage dips Dip on all three phases	EN 61000-4-11	70% of 380Vac	266Vac, 10ms	Criterion A
		40% of 380Vac	152Vac, 100ms	Criterion C
		40% of 380Vac	152Vac, 1000ms	Criterion C
Mains voltage dips Dip on one phase	EN 61000-4-11	70% of 380Vac	266Vac, 10ms	Criterion A
		40% of 380Vac	152Vac, 100ms	Criterion A
		40% of 380Vac	152Vac, 1000ms	Criterion A
Voltage interruptions	EN 61000-4-11		0Vac, 5000ms	Criterion C
Voltage sags	SEMI F47 0200	Dips on two phases according to section 7.2. (SEMI F47-200)	304Vac, 1000ms 266Vac, 500ms 190Vac, 200ms	Criterion A Criterion A Criterion A
Powerful transients	VDE 0160	over entire load range	1300V, 1.3ms	Criterion A

Criteria:

A: Power supply shows normal operation behavior within the defined limits.

C: Temporary loss of function is possible. Power supply might shut-down and restarts by itself. No damages or hazards for the power supply occur.

EMC Emission	EN 61000-6-3 and EN 61000-6-4		Generic standards
Conducted emission	EN 55011, EN 55022, FCC Part 15, CISPR 11, CISPR 22		Class B, input lines
Radiated emission	EN 55011, EN 55022		Class B
Harmonic input current	EN 61000-3-2		Fulfilled, active PFC
Voltage fluctuations, flicker	EN 61000-3-3		Fulfilled

This device complies with FCC Part 15 rules.

Operation is subjected to following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Switching Frequencies	The power supply has three converters with three different switching frequencies included. One is nearly constant. The other two are input voltage and load dependent.		
Switching frequency 1	100kHz	Nearly constant	
Switching frequency 2	30kHz to 90kHz	Input voltage and load dependent	
Switching frequency 3	40kHz to 220kHz	Input voltage and load dependent	

17. ENVIRONMENT

Operational temperature	-25°C to +70°C (-13°F to 158°F)	Reduce output power above +60°C
Output de-rating	12W/°C	60-70°C (140°F to 158°F), see Fig. 17-1
Storage temperature	-40 to +85°C (-40°F to 185°F)	Storage and transportation
Humidity	5 to 95% r.H.	IEC 60068-2-30 Do not energize while condensation is present
Vibration sinusoidal	2-17.8Hz: ±1.6mm; 17.8-500Hz: 2g 2 hours / axis	IEC 60068-2-6
Vibration random	0.5m ² (s ³) 2 hours / axis	IEC 60068-2-64
Shock	30g 6ms, 20g 11ms 3 bumps / direction, 18 bumps in total	IEC 60068-2-27
Altitude	0 to 6000m (0 to 20 000ft)	Reduce output power or ambient temperature above 2000m sea level.
Output de-rating (for altitude)	30W/1000m or 5°C/1000m	above 2000m, see Fig. 17-2
Over-voltage category	III	EN 50178, altitudes up to 2000m
	II	Altitudes from 2000m to 6000m
Degree of pollution	2	EN 50178, not conductive

Fig. 17-1 Output current vs. ambient temp.,

Fig. 17-2 Output current vs. altitude

The ambient temperature is defined as the air temperature 2cm below the unit.

18. PROTECTION FEATURES

Output protection	Electronically protected against overload, no-load and short-circuits	
Output over-voltage protection	typ. 32Vdc max. 35Vdc	In case of an internal power supply defect, a redundant circuitry limits the maximum output voltage. The output shuts-down and automatically attempts to restart.
Degree of protection	IP 20	EN/IEC 60529
Penetration protection	> 3.5mm	e.g. screws, small parts
Over-temperature protection	yes	Output shut-down with automatic restart
Input transient protection	MOV (Metal Oxide Varistor) and active transient filter	
Internal input fuse	Not included	See section 27.6

Note: In case of a protection event, audible noise may occur.

19. SAFETY

Input / output separation	SELV PELV double or reinforced insulation	IEC/EN 60950-1 EN 60204-1, EN 50178, IEC 60364-4-41
Class of protection	I	PE (Protective Earth) connection required
Isolation resistance	> 5MΩ	Input to output, 500Vdc
PE resistance	< 0.1Ω	Between housing and PE terminal
Touch current (leakage current)	< 0.5mA	3x 440Vac, 50Hz, TN mains
	< 0.7mA	3x 528Vac, 60Hz, TN mains
	typ.xmA	3x 400Vac, 50Hz, TN mains
	typ.xmA	3x 480Vac, 60Hz, TN mains

20. DIELECTRIC STRENGTH

Fig. 20-1 Dielectric strength

		A	B	C	D
Type test	60s	2500Vac	3000Vac	500Vac	500Vac
Factory test	5s	2500Vac	2500Vac	500Vac	500Vac
Field test	5s	2000Vac	2000Vac	500Vac	500Vac

Type tests and factory tests:

Conducted by the manufacturer. Do not repeat test in field!

Rules for field test:

Use appropriate test equipment which applies the voltage with a slow ramp! Connect L1, L2 and L3 together as well as all output poles.

The output voltage is floating and has no ohmic connection to ground.

To fulfill the PELV requirements according to EN60204-1 § 6.4.1, we recommend that either the + pole, the – pole or any other part of the output circuit shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off any more when unnoticed earth faults occur.

21. APPROVALS

22. FULFILLED STANDARDS

EN 61558-2-17	Safety of Power Transformers
EN/IEC 60204-1	Safety of Electrical Equipment of Machines
EN/IEC 61131-2	Programmable Controllers
EN 50178	Electronic Equipment in Power Installations

23. USED SUBSTANCES

The unit does not release any silicone and is suitable for the use in paint shops.

Electrolytic capacitors included in this unit do not use electrolytes such as Quaternary Ammonium Salt Systems.

Plastic housings and other molded plastic materials are free of halogens, wires and cables are not PVC insulated.

The production material within our production does not include following toxic chemicals:
 Polychlorized Biphenyl (PCB), Polychlorized Terphenyl (PCT), Pentachlorophenol (PCP), Polychlorinated naphthalene (PCN), Polybrom Biphenyl (PBB), Polybrom Biphenyl-oxyd (PBO), Polybrominated Diphenylether (PBDE), Polychlorinated Diphenylether (PCDE), Polydibromphenyl Oxyd (PBDO), Cadmium, Asbest, Mercury, Silicia

24. PHYSICAL DIMENSIONS AND WEIGHT

Weight	870g / 1.92lb
DIN-Rail	Use 35mm DIN-rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm. The DIN-rail height must be added to the depth (127mm) to calculate the total required installation depth.

Electronic files with mechanical data can be downloaded at www.pulspower.com

Fig. 24-1 Front view

Fig. 24-2 Side view

25. INSTALLATION AND OPERATION INSTRUCTIONS

Mounting Orientation:

Output terminal must be located on top and input terminal on the bottom. For other orientations see section 0.

Cooling:

Convection cooled, no forced cooling required. Do not cover ventilation grid (e.g. cable conduits) by more than 30%!

Installation clearances:

40mm on top, 20mm on the bottom, 5mm on the left and right side are recommended when loaded permanently with full power. In case the adjacent device is a heat source, 15mm clearance is recommended.

Risk of electrical shock, fire, personal injury or death!

Do not use the unit without proper earth connection (Protective Earth). Use the pin on the terminal block for earth connection and not one of the screws on the housing.

Turn power off before working on the power supply. Protect against inadvertent re-powering.

Make sure the wiring is correct by following all local and national codes.

Do not open, modify or repair the unit.

Use caution to prevent any foreign objects from entering into the housing.

Do not use in wet locations or in areas where moisture or condensation can be expected.

Service parts:

The unit does not contain any serviceable parts. If damage or malfunctioning should occur during operation, immediately turn power off and send unit to factory for inspection!

26. ACCESSORY

ZM1.WALL Wall mounting bracket

This bracket is used to mount Dimension units onto a flat surface without utilizing a DIN-Rail. The two aluminum brackets and the black plastic slide of the unit have to be detached, so that the two steel brackets can be mounted.

Fig. 26-1 ZM1.WALL Wall Mounting Bracket

Fig. 26-2 Assembled Wall Mounting Bracket

ZM14.SIDE Side mounting bracket

This bracket is used to mount Dimension units sideways with or without utilizing a DIN-Rail. The two aluminum brackets and the black plastic slide of the unit have to be detached, so that the steel brackets can be mounted.

For sideways DIN-rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

27. APPLICATION NOTES

27.1. REPETITIVE PULSE LOADING

Typically, a load current is not constant. It varies over time. For pulse load compatibility, following rules must be met:

- a) The pulse power demand must be below 150% of the nominal power.
- b) The duration of the pulse power must be shorter than the allowed Bonus Time. (see output section)
- c) The average (R.M.S.) output current must be below the specified continuous output current.
If the R.M.S. current is higher, the unit will respond with a thermal shut-down after a while. Use the max. duty cycle curve (Fig. 27-2) to check if the average output current is below the nominal current.
- d) The duty cycle must be below 0.75.
- e) For altitudes higher than 2000m reduce the pulse loading (15W/1000m) or the ambient temperature (5°C/1000m)

Fig. 27-1 Repetitive pulse loads, definitions

- P₀** Base load (W)
- P_{PEAK}** Pulse load (above 100%)
- T₀** Duration between pulses (s)
- T_{PEAK}** Pulse duration (s)

Fig. 27-2 Max. Duty Cycle Curve

$$\text{DutyCycle} = \frac{T_{\text{peak}}}{T_{\text{peak}} + T_0}$$

$$T_0 = \frac{T_{\text{peak}} - (\text{DutyCycle} \times T_{\text{peak}})}{\text{DutyCycle}}$$

Utilizing the Max. Duty Cycle Curve:

Example to determine the repetition rate of pulses without dipping of the output voltage:

Parameters of application:

Pulse length is T_{PEAK} = 1s

Steady state load P₀=120W
(= 50% of I_{RATED})

Peak load P_{PEAK} = 360W
(= 150% of I_{RATED})

Determining the repetition rate:

- 1) make a vertical line at P_{PEAK} = 150%
- 2) make a horizontal line where the vertical line crosses the P₀ = 50% curve
- 3) Read the Max. Duty Cycle from the Duty Cycle-axis (= 0.37)
- 4) Calculate the min. pause (base load) length T₀ :

$$T_0 = \frac{T_{\text{peak}} - (\text{DutyCycle} \times T_{\text{peak}})}{\text{DutyCycle}} = \frac{1\text{s} - (0.37 \times 1\text{s})}{0.37} = \underline{1.7\text{s}}$$

- 5) Pulse length = 1s, min. pause length = 1.7s
- 6) Max. repetition rate = pulse length + pause length = **2.7s**

More examples for pulse load compatibility:

P _{PEAK}	P ₀	T _{PEAK}	T ₀
720W	480W	1s	>25s
720W	0W	1s	>1.3s
600W	240W	1s	> 0,75s

P _{PEAK}	P ₀	T _{PEAK}	T ₀
720W	240W	0.1s	>0.16s
720W	240W	1s	>1.6s
720W	240W	3s	>4.9s

27.2. PEAK CURRENT CAPABILITY

Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady state current and usually exceeds the nominal output current (including the Bonus Power®). The same situation applies, when starting a capacitive load.

Branch circuits are often protected with circuit breakers or fuses. In case of a short or an overload in the branch circuit, the fuse needs a certain amount of over-current to trip or to blow. The peak current capability ensures the safe operation of subsequent circuit breakers.

Assuming the input voltage is turned on before such an event, the built-in large sized output capacitors inside the power supply can deliver extra current. Discharging this capacitor causes a voltage dip on the output. The following two examples show typical voltage dips:

Fig. 27-3 Peak load 40A for 50ms, typ.

Peak load 40A (resistive) for 50ms
Output voltage dips from 24V to 18V.

Fig. 27-4 Peak load 80A for 5ms, typ.

Peak load 80A (resistive) for 5ms
Output voltage dips from 24V to 16.5V.

Please note: The DC-OK relay triggers when the voltage dips more than 10% for longer than 1ms.

27.3. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter, whether the power supply is on or off.

The maximum allowed feed back voltage is 34Vdc. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 8.

27.4. CHARGING OF BATTERIES

The power supply can be used to charge lead-acid or maintenance free batteries. (Two 12V batteries in series)

Instructions for charging batteries:

- Set output voltage (measured at the battery) very precisely to the end-of-charge voltage.

End-of-charge voltage	27.8V	27.5V	27.15V	26.8V
Battery temperature	10°C	20°C	30°C	40°C
- Use a 25A circuit breaker (or blocking diode) between the power supply and the battery.
- Ensure that the output current of the power supply is below the allowed charging current of the battery.
- Use only matched batteries when putting 12V types in series.
- The return current to the power supply is typ. 16mA at 25Vdc when the power supply is switched off (except in case a blocking diode is utilized).

27.5. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCBs) can be used for branch protection. Ensure that the MCB is rated for DC voltage, too. The following tests show which circuit breakers the power supply typically trips.

Circuit breakers have huge tolerances in their tripping behavior. Therefore, these typical tests can only be used as a recommendation or for comparing two different power supplies. Furthermore, the loop impedance has a major influence on whether a breaker trips or not. Two tests were performed, representing typical situations:

Test 1: Short circuit with S1 on the power supply end of the cable (loop impedance approx. 20mOhm)

Fig. 27-5 **Branch protectors, test circuit 1**

Parameters:

Input voltage: 3x 400Vac, load current: 0A
 Tripping time shorter than 5s.

The following circuit breaker tripped during the test:

- A- or Z- Characteristic:** equal or smaller 25A
- B- Characteristic:** equal or smaller 16A
- C- Characteristic:** equal or smaller 10A

Test 2: Short circuit with S1 on the load end (additional impedance included; represents longer load wire length).

Fig. 27-6 **Branch protectors, test circuit 2**

Parameters:

Input voltage: 3x 400Vac, load current: 0A
 Tripping time shorter than 5s.

The following circuit breaker tripped during the test:

- A- or Z- Characteristic:** ≤ 16A and R < 82mOhm
- B- Characteristic:** ≤ 6A and R < 180mOhm
- C- Characteristic:** ≤ 8A and R ≤ 150mOhm

What does this resistance mean in wire length?

	0.5mm ²	0.7mm ²	1.0mm ²	1.5mm ²	2.5mm ²	4.0mm ²
82mOhm	2.3m	3.2m	4.6m	6.9m	11.4m	18.3m
150mOhm	4.2m	5.9m	8.4m	12.5m	20.9m	33.4m
180mOhm	5.0m	7.0m	10.0m	15.0m	25.1m	40.1m

Example:

Which wire gauge must be used to trip a B-Characteristic circuit breaker with a rating of 6A? The load wire length is 21m.

Answer: A 6A B-Characteristic circuit breaker requires a loop impedance of less than 180mOhm (test results). The wire length table shows that up to 25.1m wire with a cross section of 2.5mm² are below 180mOhm. A wire not smaller than 2.5mm² shall be used.

27.6. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 15A (U.S.A.) and 16A (IEC). External protection is only required, if the supplying branch has an ampacity greater than this. In some countries local regulations might apply. Check also local codes and local requirements.

If an external fuse is necessary or utilized, a minimum value is required to avoid undesired tripping of the fuse.

	B-Characteristic	C-Characteristic
Ampacity	max. 16A (U.S.A.: 15A)	16A (U.S.A.: 15A)
	min. 6A	3A

27.7. 2-PHASE OPERATION

The QT20 series is specified to operate on two phases.

Instructions for 2-ph operation:

Reduce output power according to curve. Exceeding the limits results in a thermal shut-down.

The specification for EMC performance, hold-up time, losses and output ripple will no longer be valid. Check suitability individually in the application.

Fig. 27-7 **Wiring diagram 2-phase operation**

Fig. 27-8 **2-phase operation, allowed output current**

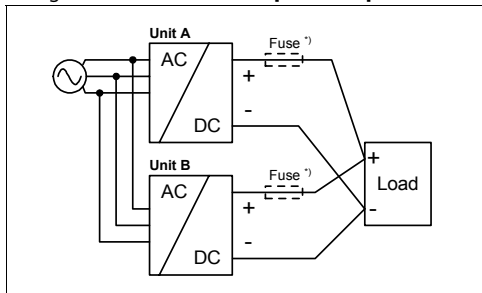

Fig. 27-9 **2-phase operation, Hold-up time**

27.8. PARALLEL USE TO INCREASE OUTPUT POWER

Power supplies can be paralleled to increase the output power.

Fig. 27-10 Schematic for parallel operation

Instructions for parallel use:

- Use only power supplies from the same series (Q-Series).
- Adjust the output voltages of all power supplies to approximately the same value ($\pm 500\text{mV}$). Otherwise, the DC-ok signal might not work properly.
- A fuse (or diode) on the output is only required if more than three units are connected in parallel.
- Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.

27.9. PARALLEL USE FOR REDUNDANCY

Power supplies can be paralleled for redundancy to gain a higher system availability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two Q-Series power supplies in parallel. This is called a 1+1 redundancy. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. Redundant systems for a higher power demand are usually built in a N+1 method. E.g. Five power supplies, each rated for 10A are paralleled to build a 40A redundant system.

Please note: This simple way to build a redundant system does not cover failures such as an internal short circuit in the secondary side of the power supply. In such a - virtually nearly impossible - case, the defect unit becomes a load for the other power supplies and the output voltage can not be maintained any more. This can only be avoided by utilizing decoupling diodes which are included in the decoupling module YR2.DIODE. (One module per power supply)

Recommendations for building redundant power systems:

- Use separate input fuses for each power supply.
- Monitor the individual power supply units. A DC-ok lamp and a DC-ok contact is already included in the units. This feature reports a faulty unit.
- When possible, connect each power supply to different phases or circuits.
- It is desirable to set the output voltages of all power supplies to the same value to avoid a false DC-ok signal.

27.10. DAISY CHAINING OF OUTPUTS

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the maximum current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block.

Fig. 27-11 Daisy chaining of outputs

Fig. 27-12 Using distribution terminals

27.11. SERIES OPERATION

The power supply can be put in series to increase the output voltage.

Fig. 27-13 Schematic for series operation

Instructions for use in series:

- It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc.
- Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.
- For serial operation use power supplies of the same type.
- Earthing of the output is required when the sum of the output voltage is above 60Vdc.
- Keep an installation clearance of 15mm (left/right) between two power supplies and avoid installing the power supplies on top of each other.

Note: Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

27.12. INDUCTIVE AND CAPACITIVE LOADS

The unit is designed to supply any kind of load, including unlimited capacitive and inductive loads.

27.13. USE IN A TIGHTLY SEALED ENCLOSURE

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. The inside temperature defines the ambient temperature for the power supply.

Results from such an installation:

Power supply is placed in the middle of the box, no other heat producer inside the box

Enclosure:	Rittal Typ IP66 Box PK 9519 100, plastic, 180x180x165mm
Load:	24V, 16A; (=80%) load is placed outside the box
Input:	3x 400Vac
Temperature inside enclosure:	55.9°C (in the middle of the right side of the power supply with a distance of 2cm)
Temperature outside enclosure:	24.9°C
Temperature rise:	31K

Mounting Orientations

Mounting orientations other than input terminals on the bottom and output on the top require a reduction in continuous output power or a limitation in the max. allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

Curve A1 Recommended output current.

Curve A2 Max allowed output current (results approx. in half the lifetime expectancy of A1).
