1. SCOPE

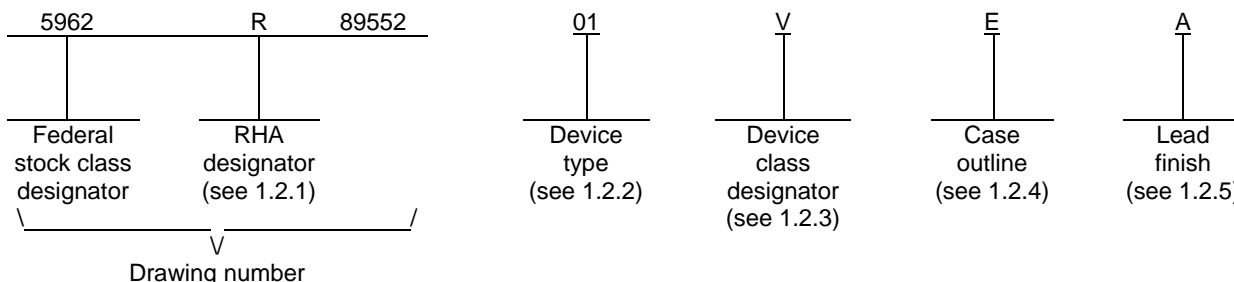

1.1 Scope. This drawing documents two product assurance class levels consisting of high reliability (device classes Q and M) and space application (device class V). A choice of case outlines and lead finishes are available and are reflected in the Part or Identifying Number (PIN). When available, a choice of Radiation Hardness Assurance (RHA) levels is reflected in the PIN.

1.2 PIN. The PIN is as shown in the following examples.

For device classes M and Q:

For device class V:

1.2.1 RHA designator. Device classes Q and V RHA marked devices meet the MIL-PRF-38535 specified RHA levels and are marked with the appropriate RHA designator. Device class M RHA marked devices meet the MIL-PRF-38535, appendix A specified RHA levels and are marked with the appropriate RHA designator. A dash (-) indicates a non-RHA device.

1.2.2 Device type(s). The device type(s) identify the circuit function as follows:

<u>Device type</u>	<u>Generic number</u>	<u>Circuit function</u>
01	54AC175	Quad D-type flip-flop with master reset

1.2.3 Device class designator. The device class designator is a single letter identifying the product assurance level as listed below. Since the device class designator has been added after the original issuance of this drawing, device classes M and Q designators will not be included in the PIN and will not be marked on the device.

<u>Device class</u>	<u>Device requirements documentation</u>
M	Vendor self-certification to the requirements for MIL-STD-883 compliant, non-JAN class level B microcircuits in accordance with MIL-PRF-38535, appendix A
Q or V	Certification and qualification to MIL-PRF-38535

		REVISION LEVEL C	SHEET 2

1.2.4 Case outline(s). The case outline(s) are as designated in MIL-STD-1835 and as follows:

<u>Outline letter</u>	<u>Descriptive designator</u>	<u>Terminals</u>	<u>Package style</u>
E	GDIP1-T16 or CDIP2-T16	16	Dual-in-line
F	GDFP2-F16 or CDFP3-F16	16	Flat pack
2	CQCC1-N20	20	Square leadless chip carrier

1.2.5 Lead finish. The lead finish is as specified in MIL-PRF-38535 for device classes Q and V or MIL-PRF-38535, appendix A for device class M.

1/ For tests not listed in the referenced MIL-STD-883, (e.g. I_{CC}(O/V1), utilize the general test procedure under the conditions listed herein.

2/ Each input/output, as applicable, shall be tested at the specified temperature, for the specified limits, to the tests in table I herein. Output terminals not designated shall be high level logic, low level logic, or open, except as follows:

- a. V_{IC} (pos) tests, the GND terminal can be open. T_C = +25°C.
- b. V_{IC} (neg) tests, the V_{CC} terminal shall be open. T_C = +25°C.
- c. All I_{CC} tests, the output terminal shall be open. When performing these tests, the current meter shall be placed in the circuit such that all current flows through the meter.

Additional detailed information on qualified devices (i.e. pin for pin conditions and testing sequence) is available from the qualifying activity (DLA Land and Maritime-VQC) upon request.

3/ RHA devices supplied to this drawing have been characterized through all levels M, D, P, L and R of irradiation. However, this device is only tested at the 'R' level. Pre and Post irradiation values are identical unless otherwise specified in table IA. When performing post irradiation electrical measurements for any RHA level, T_A = +25°C.

4/ For negative and positive voltage and current values, the sign designates the potential difference in reference to GND and the direction of current flow, respectively; and the absolute value of the magnitude, not the sign, is relative to the minimum and maximum limits, as applicable, listed herein. All devices shall meet or exceed the limits specified in table I, as applicable, at 3.0 V ≤ V_{CC} ≤ 3.6 V and 4.5 V ≤ V_{CC} ≤ 5.5 V.

5/ RHA samples do not have to be tested at -55°C and +125°C prior to irradiation.

TABLE I. Electrical performance characteristics - Continued.

- 6/ The V_{OH} and V_{OL} tests shall be tested at $V_{CC} = 3.0$ V and $V_{CC} = 4.5$ V. The V_{OH} and V_{OL} tests are guaranteed, if not tested, for $V_{CC} = 5.5$ V. Limits shown apply to operation at $V_{CC} = 3.3$ V ± 0.3 V and $V_{CC} = 5.0$ V ± 0.5 V. Transmission driving tests are performed at $V_{CC} = 5.5$ V with a 2 ms duration maximum.
- 7/ The V_{IH} and V_{IL} tests are not required if applied as forcing functions for V_{OH} and V_{OL} tests.
- 8/ Power dissipation capacitance (C_{PD}) determines both the power consumption (P_D) and current consumption (I_S). Where:

$$P_D = (C_{PD} + C_L) (V_{CC} \times V_{CC})f + (I_{CC} \times V_{CC})$$

$$I_S = (C_{PD} + C_L) V_{CC}f + I_{CC}$$
 f is the frequency of the input signal and C_L is the external output load capacitance.

 C_{IN} and C_{PD} shall be measured only for initial qualification and after process or design changes which may affect capacitance. C_{IN} shall be measured between the designated terminal and GND at a frequency of 1 MHz. C_{PD} shall be tested in accordance with the latest revision of JEDEC Standard No. 20 and table I herein. For C_{IN} and C_{PD} , test all applicable pins on five devices with zero failures.
- 9/ See JEDEC STD. 17 for electrically induced latch-up test methods and procedures. The values listed for $V_{trigger}$, $I_{trigger}$ and V_{over} , are to be accurate within ± 5 percent.
- 10/ Tests shall be performed in sequence, attributes data only. Functional tests shall include the truth table and other logic patterns used for fault detection. The test vectors used to verify the truth table shall, at a minimum, test all functions of each input and output. All possible input to output logic patterns per function shall be guaranteed, if not tested, to the truth table in figure 2 herein. Functional tests shall be performed in sequence as approved by the qualifying activity on qualified devices. For V_{OUT} measurements, $L \leq 0.3V_{CC}$ and $H \geq 0.7V_{CC}$.
- 11/ For propagation delay tests, all paths must be tested. AC limits at $V_{CC} = 5.5$ V are equal to the limits at $V_{CC} = 4.5$ V and guaranteed by testing at $V_{CC} = 4.5$ V. AC limits at $V_{CC} = 3.6$ V are equal to limits at $V_{CC} = 3.0$ V and guaranteed by testing at $V_{CC} = 3.0$ V. Minimum propagation delay time limits for $V_{CC} = 5.5$ V and $V_{CC} = 3.6$ V shall be guaranteed to be no more than 0.5 ns less than those specified at $V_{CC} = 4.5$ V and $V_{CC} = 3.0$ V, respectively, in table I herein.
