MILITARY BURN-IN

Military burn-in is in accordance with the current revision of MIL-STD-883, Test Method 1015, Conditions A through E. Test conditions are selected at AMD's option.

PIN DESCRIPTION

$A_0 - A_8$ Address (Inputs)
The 9-bit field presented at the address inputs selects one of 512 memory locations to be read from.

$Q_0 - Q_7$ Data Output Port
The outputs whose state represents the data read from the selected memory locations.

$\overline{G}$ Output Enable (Input)
Provides direct control of the Q-output buffers. Outputs disabled forces all three-state outputs to a floating or high-impedance state.

Enable = $\overline{G}$

Disable = G

V_{CC} Device Power Supply Pin
The most positive of the logic power supply pins.

GND Device Power Supply Pin
The most negative of the logic power supply pins.

ABSOLUTE MAXIMUM RATINGS

Storage Temperature ..... −65 to +150°C
Ambient Temperature with
Power Applied ..... −55 to +125°C
Supply Voltage ..... −0.5 V to +7.0 V
DC Voltage Applied to Outputs

Output Current into Outputs During
Programming (Max. Duration of 1 sec) ..... 250 mA
DC Input Voltage ..... −0.5 V to +5.5 V
DC Input Current ..... −30 mA to +5 mA

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

OPERATING RANGES

Commercial (C) Devices
Ambient Temperature (T_A) ..... 0 to +75°C
Supply Voltage (V_{CC}) ..... +4.75 V to +5.25 V

Military (M) Devices*
Case Temperature (T_C) ..... −55 to +125°C

Operating ranges define those limits between which the functionality of the device is guaranteed.

*Military product 100% tested at T_C = +25°C, +125°C, and −55°C.

Notes:
1. This applies to three-state devices only.
2. V_{IL} and V_{IH} are input conditions of output tests and are not themselves directly tested. V_{IL} and V_{IH} are absolute voltages with respect to device ground and include all overshoots due to system and/or tester noise. Do not attempt to test these values without suitable equipment.
3. Not more than one output should be shorted at a time. Duration of the short circuit should not be more than one second.
4. These parameters are not 100% tested, but are periodically evaluated at initial characterization and at any time the design is modified where capacitance may be affected.
