

AM2965, AM2966

Octal Dynamic Memory Drivers with Three-State Outputs

The AM2965 and AM2966 are designed and specified to drive the capacitive input characteristics of the address and control lines of MOS dynamic RAMs. The unique design of the lower output driver includes a collector resistor to control undershoot on the HIGH-to-LOW transition. The upper output driver pulls up to $V_{CC} - 1.15V$ to be compatible with MOS memory and is designed to have a rise time symmetrical with the lower output's controlled fall time. This allows optimization of Dynamic RAM performance.

The AM2965 and AM2966 are pin-compatible with the popular 'S240 and 'S244 with identical 3-state output enable controls. The AM2965 has inverting drivers and the AM2966 has non-inverting drivers.

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
 - Class Q Military
 - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
 - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

Am2965/Am2966

Octal Dynamic Memory Drivers with Three-State Outputs

DISTINCTIVE CHARACTERISTICS

- **Controlled rise and fall characteristics**
Internal resistors provide symmetrical drive to HIGH and LOW states, eliminating need for external series resistor.
- **Output swings designed to drive 16K and 64K RAMs**
 V_{OH} guaranteed at $V_{CC} - 1.15V$. Undershoot going LOW guaranteed at less than 0.5V.
- **Large capacitive drive capability**
35mA min source or sink current at 2.0V. Propagation delays specified for 50pF and 500pF loads.
- **Pin-compatible with 'S240 and 'S244**
Non-inverting Am2966 replaces 74S244; inverting Am2965 replaces 74S240. Faster than 'S240/244 under equivalent load.
- **No-glitch outputs**
Outputs forced into OFF state during power up and down. No glitch coming out of three-state.

GENERAL DESCRIPTION

The Am2965 and Am2966 are designed and specified to drive the capacitive input characteristics of the address and control lines of MOS dynamic RAMs. The unique design of the lower output driver includes a collector resistor to control undershoot on the HIGH-to-LOW transition. The upper output driver pulls up to $V_{CC} - 1.15V$ to be compatible with MOS memory and is designed to have a rise time symmetrical with the lower output's controlled fall time. This allows optimization of Dynamic RAM performance.

The Am2965 and Am2966 are pin-compatible with the popular 'S240 and 'S244 with identical 3-state output enable controls. The Am2965 has inverting drivers and the Am2966 has non-inverting drivers.

The inclusion of an internal resistor in the lower output driver eliminates the requirement for an external series resistor, therefore reducing package count and the board area required. The internal resistor controls the output fall and undershoot without slowing the output rise.

These devices are designed for use with the Am2964 Dynamic Memory Controller where large dynamic memories with highly capacitive input lines require additional buffering. Driving eight address lines or four RAS and four CAS lines with drivers on the same silicon chip also provides a significant performance advantage by minimizing skew between drivers. Each device has specified skew between drivers to improve the memory access worst case timing over the min and max t_{PD} difference of unspecified devices.

ORDERING INFORMATION

Standard Products

AMD standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of:

- a. Device Number
- b. Speed Option (if applicable)
- c. Package Type
- d. Temperature Range
- e. Optional Processing

Valid Combinations	
AM2965	JC, PC
AM2966	JC, PC, SC

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations or to check on newly released combinations, and to obtain additional data on AMD's standard military grade products.

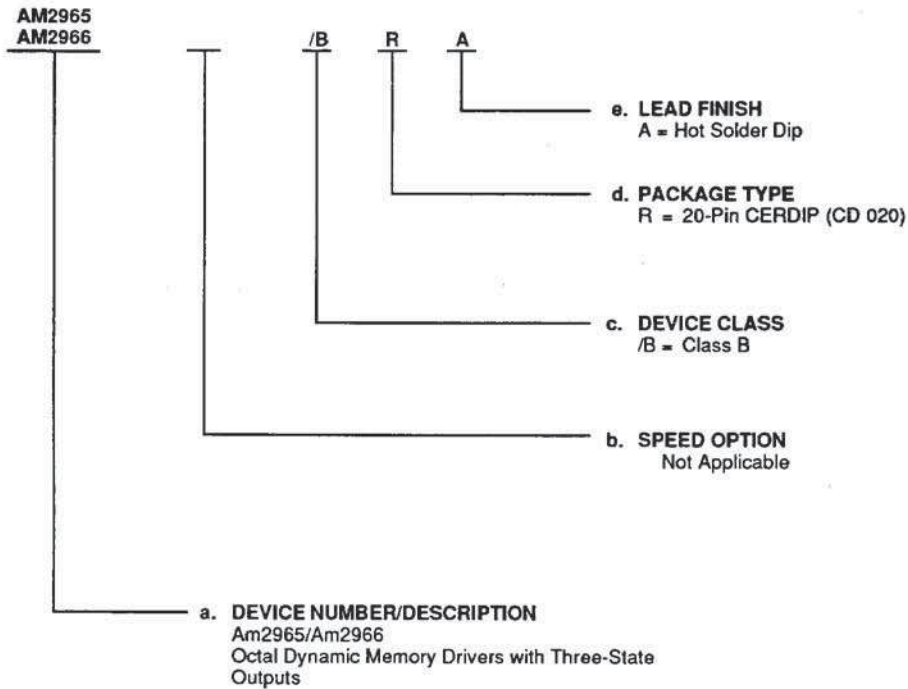

MILITARY ORDERING INFORMATION

APL Products

AMD products for Aerospace and Defense applications are available in several packages and operating ranges. APL (Approved Products List) products are fully compliant with MIL-STD-883C requirements. The order number (Valid Combination) is formed by a combination of:

- a. Device Number
- b. Speed Option (if applicable)
- c. Package Type
- d. Temperature Range
- e. Optional Processing

Valid Combinations	
AM2965	/BRA
AM2966	

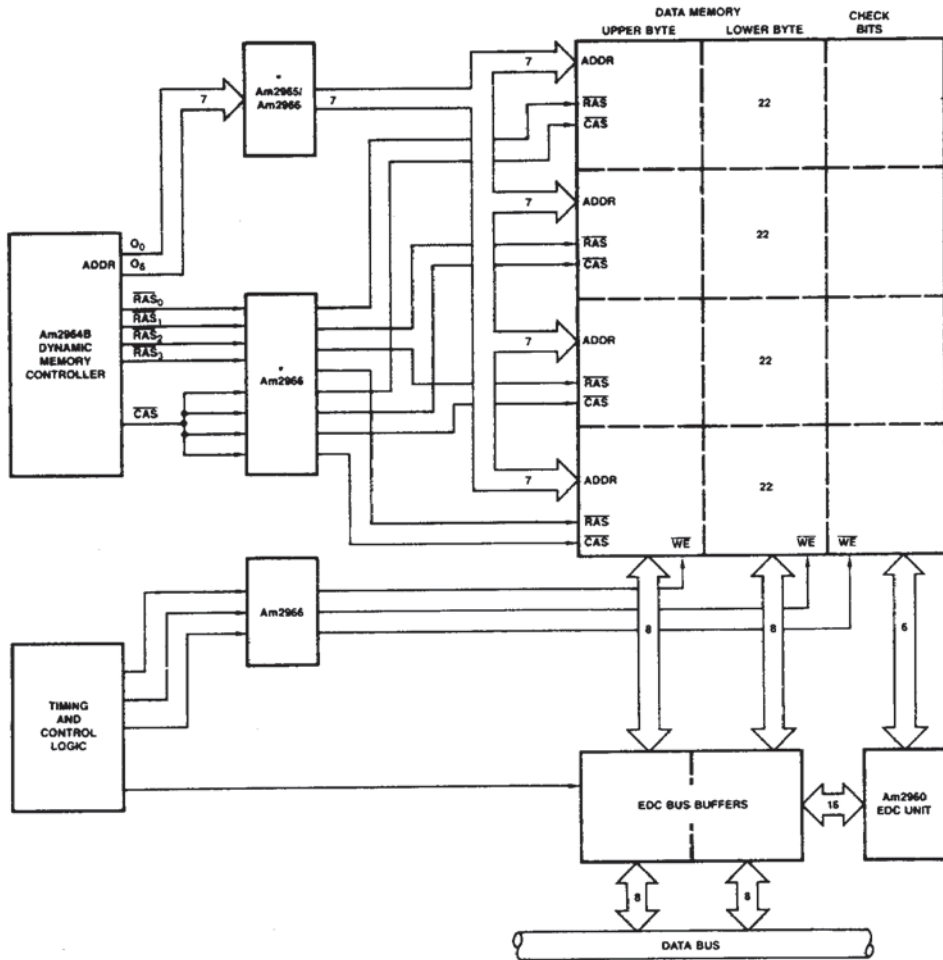

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations, to check on newly released combinations.

Group A Tests

Group A tests consists of Subgroups
1, 2, 3, 7, 8, 9, 10, 11

APPLICATION

AF000401

*Address and $\overline{\text{RAS}}/\overline{\text{CAS}}$ drivers each drive 22 RAM inputs at each output. Timing skew is minimized by using one device for address lines and one device for $\overline{\text{RAS}}/\overline{\text{CAS}}$, spreading the $\overline{\text{CAS}}$ loading over four drivers to equalize the capacitive load on each driver.

DYNAMIC MEMORY CONTROL WITH ERROR DETECTION AND CORRECTION

ABSOLUTE MAXIMUM RATINGS

Storage Temperature	-65°C to +150°C
Temperature (Case)	
Under Bias	-55°C to +125°C
Supply Voltage to Ground Potential	
Continous	-0.5V to +7.0V
DC Voltage Applied to Outputs For	
High Output State	-0.5V to V_{CC} Max
DC Input Voltage	-0.5V to +7.0V
DC Output Current, Into Outputs	200mA
DC Input Current	-30mA to +5.0mA

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

OPERATING RANGES

Commercial (C) Devices	
Temperature	0°C to +70°C
Supply Voltage	+4.75V to +5.25V
Military (M) Devices	
Temperature	-55°C to +125°C
Supply Voltage	+4.5V to +5.5V

Operating ranges define those limits over which the functionality of the device is guaranteed.

DC CHARACTERISTICS over operating ranges unless otherwise specified (for APL Products, Group A Subgroups 1, 2, 3, 7, and 8 are tested unless otherwise noted)

Parameters	Descriptions	Test Conditions (Note 1)		Min	Typ (Note 2)	Max	Units	
V_{OH}	Output HIGH Voltage	$V_{CC} = \text{MIN}$ $V_{IN} = V_{IH}$ or V_{IL}	$I_{OH} = -1\text{mA}$	$V_{CC} - 1.15$	$V_{CC} - 0.7V$		Volts	
V_{OL}	Output LOW Voltage	$V_{CC} = \text{MIN}$ $V_{IN} = V_{IH}$ or V_{IL}	$I_{OL} = 1\text{mA}$ $I_{OL} = 12\text{mA}$			0.5 0.8	Volts	
V_{IH}	Input HIGH Level	Guaranteed input logical HIGH voltage for all inputs		2.0			Volts	
V_{IL}	Input LOW Level	Guaranteed input logical LOW voltage for all inputs				0.8	Volts	
V_I	Input Clamp Voltage	$V_{CC} = \text{MIN}$, $I_{IN} = -18\text{mA}$				-1.2	Volts	
I_{IL}	Input LOW Current	$V_{CC} = \text{MAX}$, $V_{IN} = 0.4V$	DATA TG, 2G			-200 -400	μA	
I_{IH}	Input HIGH Current	$V_{CC} = \text{MAX}$, $V_{IN} = 2.7V$				20	μA	
I_I	Input HIGH Current	$V_{CC} = \text{MAX}$, $V_{IN} = 7.0V$				0.1	mA	
I_{OZH}	Off-State Current	$V_O = 2.7V$				100	μA	
I_{OZL}	Off-State Current	$V_O = 0.4V$				-200	μA	
I_{OL}	Output Sink Current	$V_{OL} = 2.0V$		50			mA	
I_{OH}	Output Source Current	$V_{OH} = 2.0V$		-35			mA	
I_{SC}	Output Short Circuit Current (Note 3)	$V_{CC} = \text{MAX}$		-60 (see I_{OH})		-200	mA	
I_{CC}	Supply Current	Am2965	All Outputs HIGH	$V_{CC} = \text{MAX}$ Outputs Open		24	50	mA
			All Outputs LOW			86	125	
			All Outputs Hi-Z			86	125	
		Am2966	All Outputs HIGH			53	75	
			All Outputs LOW			92	130	
			All Outputs Hi-Z			116	150	

- Notes: 1. For conditions shown as MIN or MAX, use the appropriate value specified under Operating Range for the applicable device type.
 2. Typical limits are at $V_{CC} = 5.0V$, 25°C ambient and maximum loading.
 3. Not more than one output should be shorted at a time. Duration of the short circuit test should not exceed one second.

SWITCHING TEST CIRCUIT

* t_{pd} specified at $C_L = 50$ and 500pF .
Figure 1. Capacitive Load Switching.

- Notes: 4. Typical time shown for reference only – not tested.
- 5. Time Skew specification is guaranteed by design but not tested.
- 6. AC performance over the operating temperature range is guaranteed by testing defined in Group A, Subgroup 9.
- 7. $T_C = -55$ to $+125^\circ\text{C}$ for Flatpak versions.

TYPICAL SWITCHING CHARACTERISTICS

SWITCHING TEST WAVEFORMS

$t_r = t_f = 2.5ns$
 $f = 2.5MHz$
 $t_{pw} = 200ns$

Figure 3. Output Drive Levels.

The RAM Driver symmetrical output design offers significant improvement over a standard Schottky output by providing a balanced drive output impedance ($\approx 25\Omega$ both HIGH and LOW), and by pulling up to MOS V_{OH} levels ($V_{CC} - 1.5V$). External resistors, not required with the RAM Driver, protect standard Schottky drivers from error causing undershoot but also slow the output rise by adding to the internal R.

$t_r = t_f = 2.5ns$
 $f = 1MHz$
 $t_{pw} = 800ns$

Figure 4. Three-State Control Levels.

The RAM Driver is optimized to drive LOW at maximum speed based on safe undershoot control and to drive HIGH with a symmetrical speed characteristic. This is an optimum approach, because the dominant RAM loading characteristic is input capacitance.

The curves shown below provide performance characteristics typical of both the inverting (Am2965) and non-inverting (Am2966) RAM Drivers.

Figure 5. t_{PLH} for $V_{OH} = 2.7$ Vol vs. C_L .

Figure 6. t_{PHL} for $V_{OL} = 0.8$ Volts vs. C_L .

The curves above depict the typical t_{PLH} and t_{PHL} for the RAM Driver outputs as a function of load capacitance. The minimums and maximums are shown for worst case design. The typical band is provided as a guide for intermediate capacitive loads.
