

# **AM29C861A**, **AM29C863A**

## High Performance CMOS Bus Transceivers

The AM29C861A and AM29C863A CMOS Bus Transceivers provide high-performance bus interface buffering for wide address/data paths or busses carrying parity. The AM29C861A is a 10-bit bidirectional transceiver; the AM29C863A is a 9-bit transceiver with NORed output enables for maximum control flexibility. Each device features data inputs with 200-mV typical input hysteresis to provide improved noise immunity. The AM29C861A and AM29C863A are produced with AMD's exclusive CS11SA CMOS process, and features a typical propagation delay of 4 ns, as well as an output current drive of 48 mA.

# Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

## **Quality Overview**

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
  - Class Q Military
  - · Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
  - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

# Am29C861A/Am29C863A

Advanced Micro Devices

High Performance CMOS Bus Transceivers

#### DISTINCTIVE CHARACTERISTICS

- High-speed CMOS bidirectional bus transceivers
  - T-R delay = 4 ns typical
- Low standby power
- Very high output drive
   Io. = 48 mA Commercial, 32 mA Military
- 200-mV typical hysteresis on data input ports
- Proprietary edge-rate controlled outputs dramatically reduce undershoots, overshoots, and ground bounce
- Power-up/down disable circuit provides for glitch-free power supply sequencing
- Can be powered off while in 3-state, ideal for card edge interface applications
- Minimal speed degradation with multiple outputs switching
- JEDEC FCT-compatible specs

### **GENERAL DESCRIPTION**

The Am29C861A and Am29C863A CMOS Bus Transceivers provide high-performance bus interface buffering for wide address/data paths or buses carrying parity. The Am29C861A is a 10-bit bidirectional transceiver; the Am29C863A is a 9-bit transceiver with NORed output enables for maximum control flexibility. Each device features data inputs with 200-mV typical input hysteresis to provide improved noise immunity. The Am29C861A and Am29C863A are produced with AMD's exclusive CS11SA CMOS process, and features a typical propagation delay of 4 ns, as well as an output current drive of 48 mA.

The Am29C861A and Am29C863A incorporate AMD's proprietary edge-controlled outputs in order to minimize simultaneous switching noise (ground bounce), undershoots and overshoots. By controlling the output transient currents, ground bounce and output ringing have

been greatly reduced. A modified AMD output provides a stable, usable voltage level in less time than a non-controlled output.

Additionally, speed degradation due to increasing number of outputs switching is reduced. Together, these benefits of edge-rate control result in significant increase in system performance despite a minor increase in device propagation delay.\*

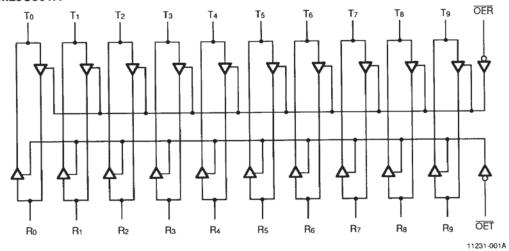

A unique I/O circuitry which utilizes n-channel pull-up transistors (eliminating the parasitic diode to Vcc) provides for high-impedance outputs during power-off and power-up/down sequencing, thus providing glitch-free operation for card-edge and other active bus applications.

The Am29C861A and Am29C863A are available in the standard package options: DIPs, PLCCs, and SOICs.

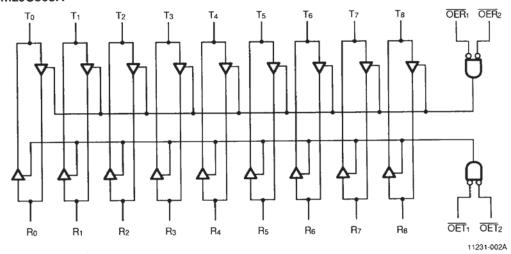

<sup>\*</sup> For more details refer to a Minimization of Ground Bounce Through Output Edge-Rate Control Application Note (See Chapter 3).

### ORDERING INFORMATION **Standard Products**

AMD standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of:

- a. Device Number
  b. Speed Option (if applicable)
  c. Package Type
  d. Temperature Range
  e. Optional Processing

Valid Com	Valid Combinations						
AM29C861A	B0 00 10						
AM29C863A	PC, SC, JC						

### Valid Combinations

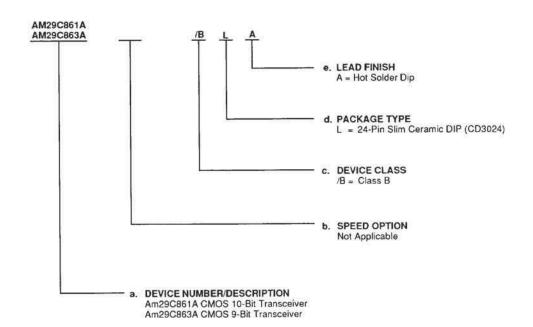

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations or to check on newly released combinations, and to obtain additional data on AMD's standard military grade products.

### MILITARY ORDERING INFORMATION **APL Products**

AMD products for Aerospace and Defense applications are available in several packages and operating ranges. APL (Approved Products List) products are fully compliant with MIL-STD-883C requirements. The order number (Valid Combination) is formed by a combination of:

Device Number Speed Option (if applicable) Device Class Package Type Lead Finish

a. b. c. d.

Valid Comb	inations
AM29C861A	(D) A
AM29C863A	/BLA

#### **Valid Combinations**

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations, or to check on newly released combinations.

### **Group A Tests**

Group A tests consist of Subgroups 1, 2, 3, 7, 8, 9, 10, 11.

### PIN DESCRIPTION Am29C861A Only

#### **OER**

### Output Enable Receive (Input, Active Low)

When LOW in conjunction with  $\overline{\text{OET}}$  HIGH, the devices are in the Receive mode (Ri are outputs, Ti are inputs).

#### OFT

### Output Enable Transmit (Input, Active Low)

When LOW in conjunction with  $\overline{OER}$  HIGH, the devices are in the Transmit mode ( $R_i$  are inputs,  $T_i$  are output).

#### R

### Receive Port (Input/Output)

 $\mbox{\rm R}_{\rm i}$  are the 10-bit data inputs in the Transmit mode, and the outputs in the Receive mode.

#### $T_i$

#### Transmit Port (Input/Output)

 $T_{\rm i}$  are the 10-bit data outputs in the Transmit mode, and the inputs in the Receive mode.

### Am29C863A Only

#### **OER**i

### Output Enables Receive (Input, Active Low)

When both  $\overline{OER_1}$  and  $\overline{OER_2}$  are LOW while  $\overline{OET_1}$  or  $\overline{OET_2}$  (or both) are HIGH, the device is in the Receive mode (R<sub>i</sub> are outputs, T<sub>i</sub> are inputs).

### OET;

### Output Enables Transmit (Input, Active Low)

When both  $\overline{\text{OET}_1}$  and  $\overline{\text{OET}_2}$  are LOW while  $\overline{\text{OER}_1}$  or  $\overline{\text{OER}_2}$  (or both) are HIGH, the device is in the Transmit mode (R<sub>i</sub> are inputs, T<sub>i</sub> are outputs).

#### $R_{i}$

#### Receive Port (Input/Output)

 $R_{\rm i}$  are the 9-bit data inputs in the Transmit mode, and the outputs in the Receive mode.

#### Ti

#### Transmit Port (Input/Output)

 $T_{\rm i}$  are the 9-bit data outputs in the Transmit mode, and the inputs in the Receive mode.

### **ABSOLUTE MAXIMUM RATINGS**

-65 to +150°C Storage Temperature

Supply Voltage to Ground Potential Continuous

-0.5 V to +7.0 V -0.5 V to +6.0 V DC Output Voltage -0.5 V to +6.0 V

DC Input Voltage DC Output Diode Current:

+ 50 mA Into Output Out of Output - 50 mA + 20 mA Into Input

DC Input Diode Current: DC Output Current:

Out of Input - 20 mA Into Output + 100 mA

Out of Output - 100 mA Total DC Ground Current (n x loL + m x lcct) mA (Note 1)

Total DC Vcc Current (n x lon + m x lccr) mA (Note 1) Stresses above those listed under Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maxi-mum ratings for extended periods may affect device reliability.

### **OPERATING RANGES**

Commercial (C) Devices

Ambient Temperature (TA) Supply Voltage (Vcc)

0 to +70°C +4.5 V to +5.5 V

Military (M) Devices

Ambient Temperature (TA) Supply Voltage (Vcc)

-55 to +125°C +4.5 V to +5.5 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

### DC CHARACTERISTICS over COMMERCIAL operating ranges unless otherwise specified (for APL Products, Group A, Subgroups 1, 2, 3 are tested unless otherwise noted)

### Notes:

- 1. n = number of outputs, m = number of inputs.
- 2. Input thresholds are tested in combination with other DC parameters or by correlation.
- 3. Not more than one output should be shorted at a time. Duration should not exceed 100 milliseconds.
- 4. Measured at a frequency ≤ 10 MHz with 50% duty cycle.
- Not included in Group A tests.

SWITCHING CHARACTERISTICS for light capacitive loading over operating ranges unless otherwise specified (for APL Products, Group A, Subgroups 9, 10, 11 are tested unless otherwise noted)
