SN54LS224A, SN74LS224A

16x4 Synchronous First-In, First-Out Memories With 3-State Outputs

The SN54LS224A and SN74LS224A 64-bit, low-power Schottky memories are organized as 16 words by 4 bits each. They can be expanded in multiples of 15m + 1 words or 4n bits, or both (where n is the number of packages in the vertical array and m is the number of packages in the horizontal array); however, some external gating is required. For longer words, the input-ready (IR) signals of the first-rank packages and output-ready (OR) signals of the last-rank packages must be ANDed for proper synchronization.

A first-in, first-out (FIFO) memory is a storage device that allows data to be written to and read from its array at independent data rates. These FIFOs are designed to process data at rates up to 10 MHz in a bit-parallel format, word by word.

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

Quality Overview

- ISO-9001
- AS9120 certification
- Qualified Manufacturers List (QML) MIL-PRF-38535
    - Class Q Military
    - Class V Space Level
- Qualified Suppliers List of Distributors (QSLD)
    - Rochester is a critical supplier to DLA and meets all industry and DLA standards.

Rochester Electronics, LLC is committed to supplying products that satisfy customer expectations for quality and are equal to those originally supplied by industry manufacturers.

The original manufacturer's datasheet accompanying this document reflects the performance and specifications of the Rochester manufactured version of this device. Rochester Electronics guarantees the performance of its semiconductor products to the original OEM specifications. 'Typical' values are for reference purposes only. Certain minimum or maximum ratings may be based on product characterization, design, simulation, or sample testing.

- **Independent Synchronous Inputs and Outputs**
- **16 Words by 4 Bits Each**
- **3-State Outputs Drive Bus Lines Directly**
- **Data Rates up to 10 MHz**
- **Fall-Through Time 50 ns Typical**
- **Data Terminals Arranged for Printed Circuit Board Layout**
- **Expandable Using External Gating**
- **Packaged in Standard Plastic (N) and Ceramic (J) 300-mil DIPs, and Ceramic Chip Carriers (FK)**

description

The SN54LS224A and SN74LS224A 64-bit, low-power Schottky memories are organized as 16 words by 4 bits each. They can be expanded in multiples of 15m + 1 words or 4n bits, or both (where n is the number of packages in the vertical array and m is the number of packages in the horizontal array); however, some external gating is required. For longer words, the input-ready (IR) signals of the first-rank packages and output-ready (OR) signals of the last-rank packages must be ANDed for proper synchronization.

A first-in, first-out (FIFO) memory is a storage device that allows data to be written to and read from its array at independent data rates. These FIFOs are designed to process data at rates up to 10 MHz in a bit-parallel format, word by word.

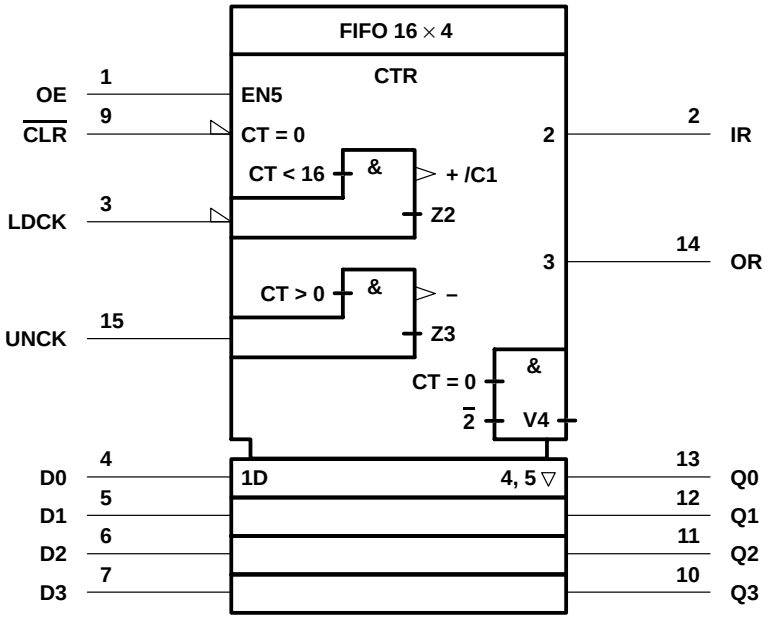
The load clock (LDCK) normally is held low, and data is written into memory on the high-to-low transition of LDCK. The unload clock (UNCK) normally is held high, and data is read out on the low-to-high transition of UNCK. The memory is full when the number of words clocked in exceeds by 16 the number of words clocked out. When the memory is full, LDCK signals have no effect on the data residing in memory. When the memory is empty, UNCK signals have no effect.

Status of the FIFO memory is monitored by the IR and OR flags that indicate not-full and not-empty conditions. IR is high only when the memory is not full and LDCK is low. OR is high only when the memory is not empty and UNCK is high.

A low level on the clear ($\overline{CLR}$) input resets the internal stack-control pointers and also sets IR high and OR low to indicate that old data remaining at the data outputs is invalid. Data outputs are noninverting, with respect to the data inputs, and are at high impedance when the output-enable (OE) input is low. OE does not affect the IR and OR outputs.

The SN74LS224A is characterized for operation from 0°C to 70°C. The SN54LS224A is characterized over the full military temperature range of –55°C to 125°C.

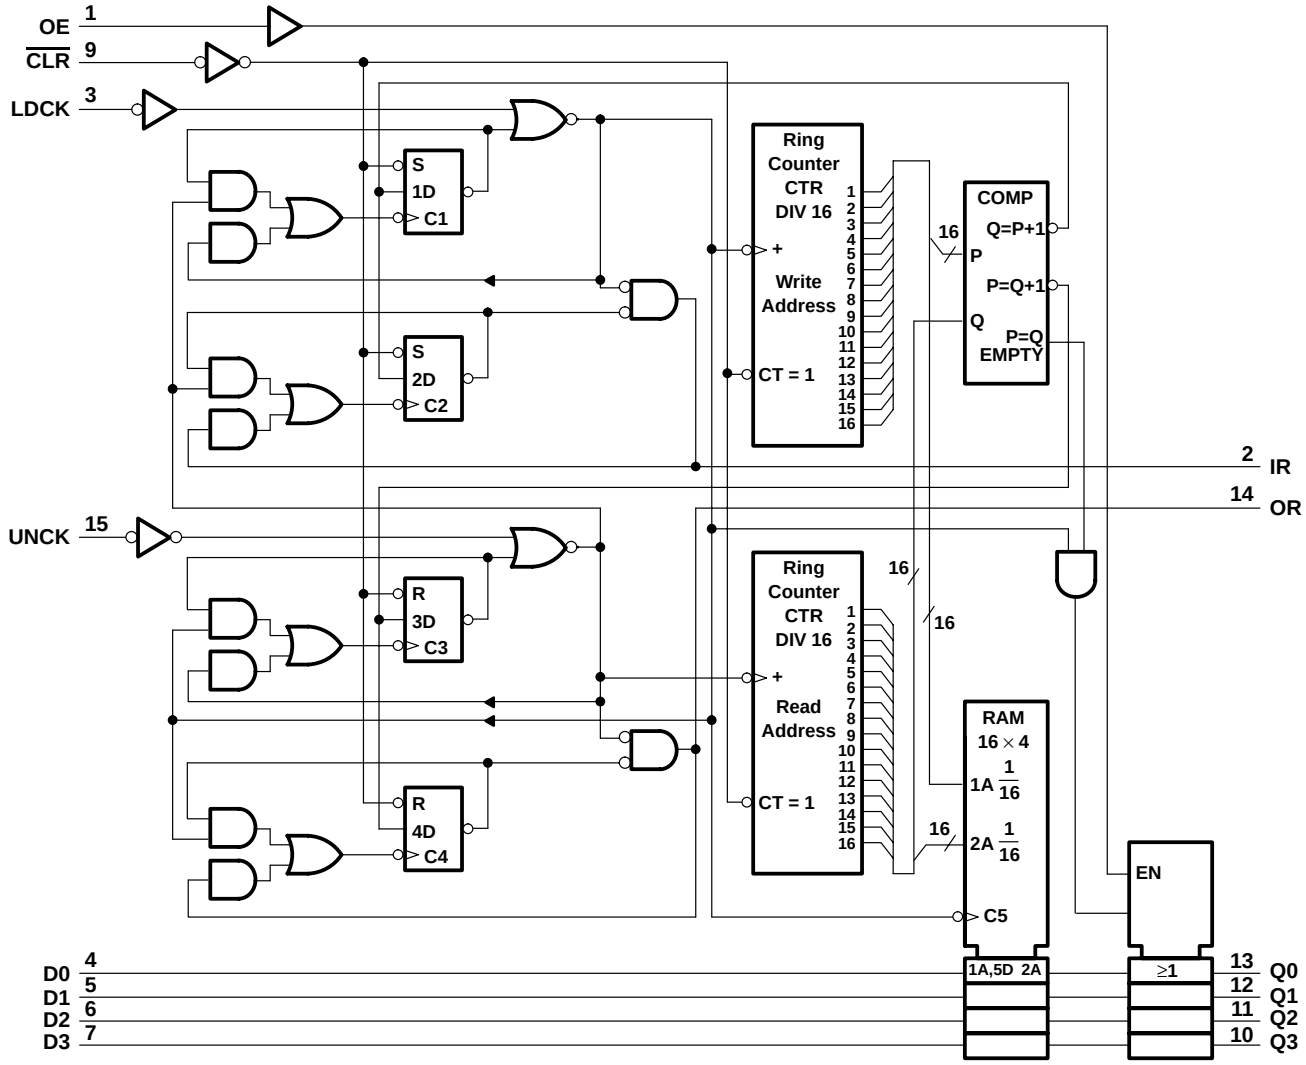
logic symbol†



† This symbol is in accordance with ANSI/IEEE Standard 91-1984 and IEC Publication 617-12. This symbol is functionally accurate but does not show the details of implementation; for these details, see the logic diagram. The symbol represents the memory as if it were controlled by a single counter whose content is the number of words stored at the time. Output data is invalid when the counter content (CT) is 0.

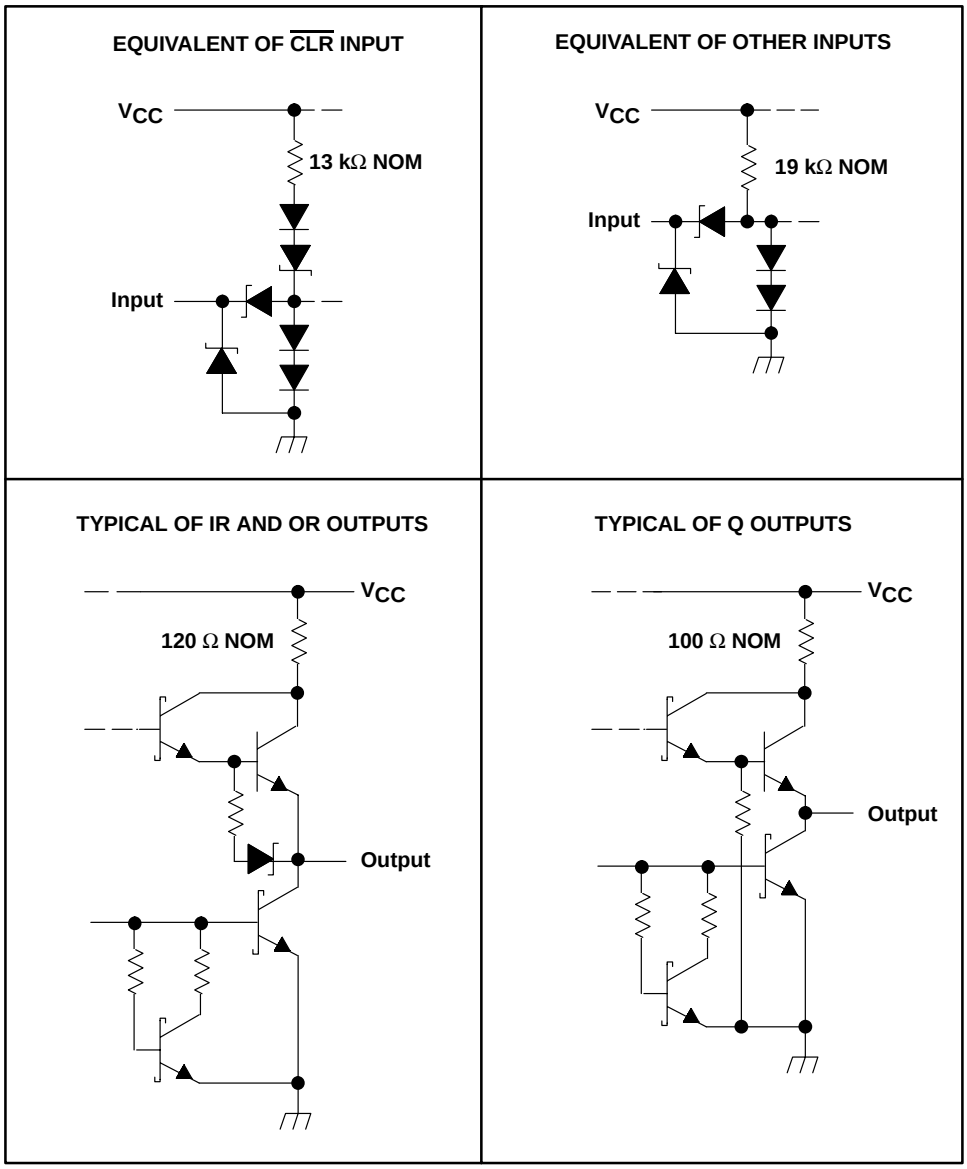
Pin numbers shown are for the J and N packages.

logic diagram (positive logic)

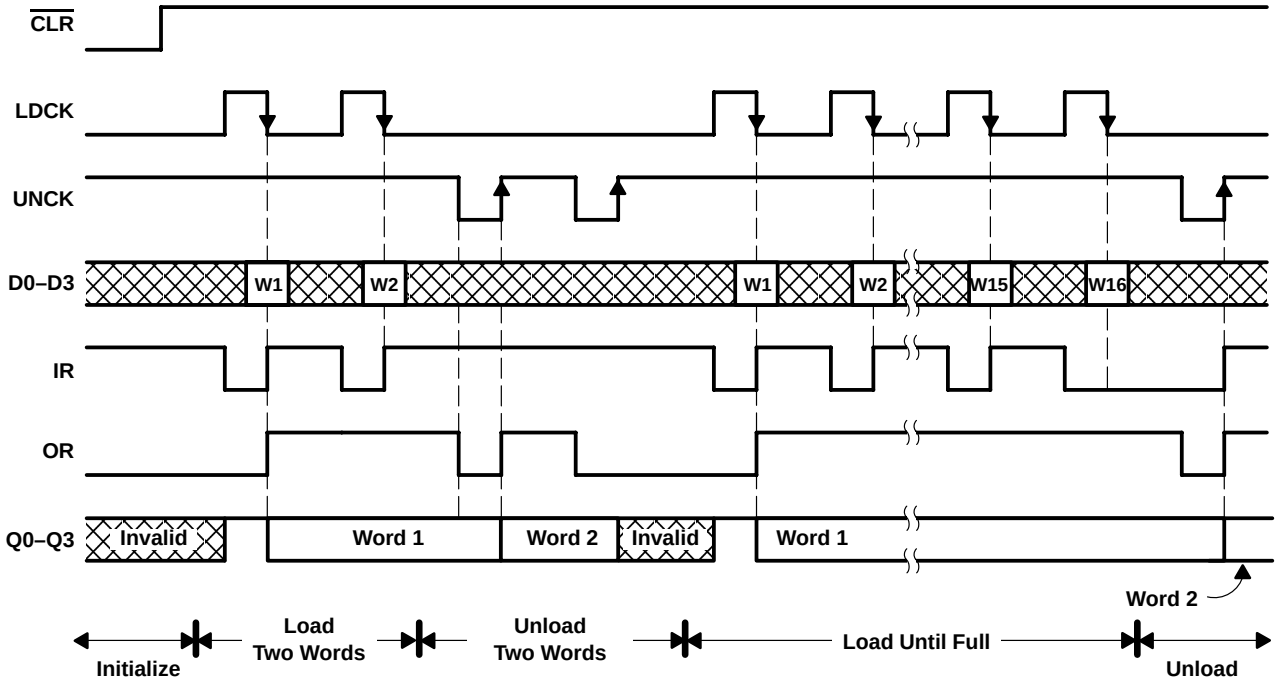


Pin numbers shown are for the J and N packages.

schematics of inputs and outputs



timing diagram



absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC} (see Note 1) . . . . . –0.5 V to 7 V
Input voltage range, V_I . . . . . –0.5 V to 7 V
Off-state output voltage range, V_O . . . . . –0.5 V to 5.5 V
Package thermal impedance, θ_{JA}: N package (see Note 2) . . . . . 67°C/W
N package (see Note 3) . . . . . 88°C/W
Storage temperature range, T_{stg} . . . . . –65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. All voltage values are with respect to GND.
2. The package thermal impedance is calculated in accordance with JESD 51-7.
3. The package thermal impedance is calculated in accordance with JESD 51-3.

recommended operating conditions (see Note 4)

			SN54LS224A			SN74LS224A			UNIT
			MIN	NOM	MAX	MIN	NOM	MAX	
V_{CC}	Supply voltage		4.5	5	5.5	4.75	5	5.25	V
V_{IH}	High-level input voltage		2			2			V
V_{IL}	Low-level input voltage				0.7			0.8	V
I_{OH}	High-level output current	Q outputs			–1			–2.6	mA
		IR, OR			–0.4			–0.4	
I_{OL}	Low-level output current	Q outputs			12			24	mA
		IR, OR			4			8	
T_A	Operating free-air temperature		–55		125	0		70	°C

NOTE 4: To ensure proper operation of this high-speed FIFO device, it is necessary to provide a clean signal to the LDCK and UNCK clock inputs. Any excessive noise or glitching on the clock inputs that violates the V_{IL}, V_{IH}, or minimum pulse-duration limits can cause a false clock or improper operation of the internal read and write pointers.

electrical characteristics over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS†		SN54LS224A			SN74LS224A			UNIT
				MIN	TYP‡	MAX	MIN	TYP‡	MAX	
V_{IK}		V_{CC} = MIN,	I_I = –18 mA			–1.5			–1.5	V

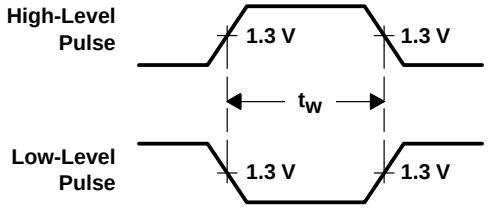
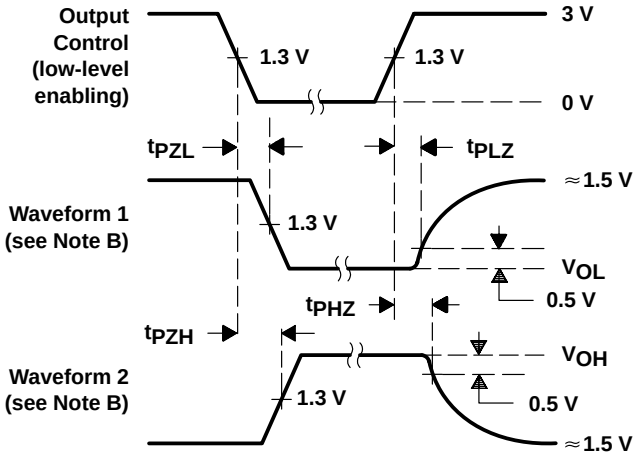
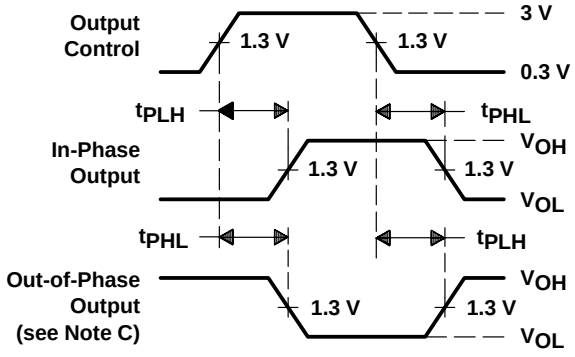
VOLTAGE WAVEFORMS
SETUP AND HOLD TIMES



VOLTAGE WAVEFORMS
PULSE DURATIONS



VOLTAGE WAVEFORMS
ENABLE AND DISABLE TIMES, 3-STATE OUTPUTS



VOLTAGE WAVEFORMS
PROPAGATION DELAY TIMES

NOTES: A. C_L includes probe and jig capacitance.
B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
C. All input pulses have the following characteristics: PRR ≤ 1 MHz, t_r < 15 ns, t_f < 6 ns, Z_O ≈ 50 Ω.
D. All diodes are 1N916 or 1N3064.
E. The outputs are measured one at a time with one transition per measurement.
