8-Line to 1-Line Data Selectors/Multiplexers/Registers

These monolithic data selectors/multiplexers contain full on-chip binary decoding to select one of eight data sources. The data-select address is stored in transparent latches that are enabled by a low level on pin 11, SC. On the ‘LS354 and ‘LS355 a similar enable for data is obtained by a low level on pin 9, DC. The edge-triggered data registers of the ‘LS356 is clocked by a low-to-high transition on pin 9, CLK. Complementary outputs are available in either three-state versions (‘LS354 and ‘LS356) or open-collector version (‘LS355).

Rochester Electronics Manufactured Components

Rochester branded components are manufactured using either die/wafers purchased from the original suppliers or Rochester wafers recreated from the original IP. All recreations are done with the approval of the OCM.

Parts are tested using original factory test programs or Rochester developed test solutions to guarantee product meets or exceeds the OCM data sheet.

description

These monolithic data selectors/multiplexers contain full on-chip binary decoding to select one of eight data sources. The data-select address is stored in transparent latches that are enabled by a low level on pin 11, $\overline{SC}$. On the 'LS354 and 'LS355 a similar enable for data is obtained by a low level on pin 9, $\overline{DC}$. The edge-triggered data registers of the 'LS356 is clocked by a low-to-high transition on pin 9, CLK. Complementary outputs are available in either three-state versions ('LS354 and 'LS356) or open-collector version ('LS355).

The SN54LS354 through SN54LS356 are characterized for operation over the full military temperature range of −55°C to 125°C. The SN74LS354 through SN74LS356 are characterized for operation from 0°C to 70°C.

H = high level (steady state)
L = low level (steady state)
X = irrelevant (any input, including transitions)
Z = high-impedance state (off state)
↑ = transition from low to high level
D0 . . . D7 = the level of steady-state inputs at inputs D0 through D7, respectively, at the time of the low-to-high clock transition in the cae of 'LS356.
$D0_n$ . . . $D7_n$ = the level of steady state inputs at inputs D0 through D7, respectively, before the most recent low-to-high transition of data control or clock
This column shows the input address setup with $\overline{SC}$ low.
