Software

ST Configurator™

Used for setup and configuration of the drive. For more information about the ST Configurator™ visit the Applied Motion Products website.

Q Programmer™

Q Programmer™ is used to create and edit stand-alone programs for Q drives. The functions of these drives include multi-tasking, math, register manipulation, encoder following, and more.

Si Programmer™

Intended for use in stand-alone applications, Si Programmer™ provides a user friendly, point-and-click, graphical interface that doesn't require any previous programming experience.

Help Manuals

ST Configurator™ incorporates context sensitive help. All the technical data, application information and advice on setting up the drive is just a mouse click away.

All software applications run on Windows 7 (32-bit & 64-bit), Vista, XP, 2000, NT, ME, 98.

Accessories

Power Supplies

Applied Motion offers two matched power supplies for use with the ST Drives. A 24VDC, 150W supply (part number PS150A24) and a 48VDC, 320W supply (part number PS320A48). These power supplies have current overload capability making them ideal for use with stepper drives.

RC-050 Regeneration Clamp

The RC-050 regeneration clamp is for use where regeneration from the motor may cause an over-voltage condition at the power supply. In these cases the RC-050 is connected between the drive and power supply and absorbs regenerated energy.

Anti-Resonance/Electronic Damping

Step motor systems have a natural tendency to resonate at certain speeds. The ST drives automatically calculate the system's natural frequency and apply damping to the control algorithm. This greatly improves midrange stability, allows higher speeds and greater torque utilization, and also improves settling times.

Benefit: Delivers better motor performance and higher speeds

Microstep Emulation

With Microstep Emulation, low resolution systems can still provide smooth motion. The drive can take low-resolution step pulses and create fine resolution micro-step motion.

Benefit: Delivers smoother motion in any application

Torque Ripple Smoothing

All step motors have an inherent low speed torque ripple that can affect the motion of the motor. By analyzing this torque ripple the system can apply a negative harmonic to negate this effect, which gives the motor much smoother motion at low speed.

Benefit: Delivers smoother motion at lower speeds

Command Signal Smoothing

Command signal smoothing can soften the effect of immediate changes in velocity and direction, making the motion of the motor less jerky. An added advantage is that it can reduce the wear on mechanical components.

Benefit: Delivers smoother system performance

Self Test & Auto Setup

At start-up the drive measures motor parameters, including the resistance and inductance, then uses this information to optimize the system performance. The drive can also detect open and short circuits.

Option Boards

The following option boards are available with the ST drives (depending on control option)

Encoder Feedback

(Q, Si, C and IP control options)

Example: ST5-Si-NE

The Encoder Feedback option board provides Stall Detection and Stall Prevention functionality to the drive. Stall Detection detects the moment the motor has stalled and triggers a drive fault. Stall Prevention automatically senses rotor lag (just before stalling) and reduces motor speed to avoid stalling. Stall Prevention includes Position Maintenance, which maintains shaft position when the motor is stopped.

RS-485

(Q control option)

Example: ST10-Q-RN

The RS-485 option board enhances the ability to stream serial commands (SCL) by allowing you to connect to up to 32 drives in a serial communications network.

Ethernet & EtherNet/IP

(Q control option for Ethernet TCP/UDP)

(IP control option for EtherNet/IP)

Examples: ST5-Q-EN, ST5-IP-EN

ST-Q drives with the Ethernet option can accept streaming serial commands (SCL) and Q serial commands over a high throughput, high-

reliability 100Mbit network. The drives can also execute Q programs stored in built-in, non-volatile memory. IP models communicate with PLCs and other industrial devices supporting the EtherNet/IP standard. They can also be commanded to execute stored Q programs.

CANopen

(C control option)

Example: ST5-C-CN

The CANopen option board used with ST-C drives allows the drive to be connected to a CANopen network along with other CANopen devices. Drives can be controlled and interrogated over the network.
