## REVERSED BATTERY AND OVERVOLTAGE PROTECTION

### FEATURES

- 8A DIODE TO GUARD AGAINST BATTERY REVERSAL.
- NEGATIVE OVERVOLTAGE PROTECTION BY CLAMPING.
- COMPLIANT WITH ISO/DTR 7637 STANDARD FOR PULSES 1, 2, 3a and 3b.
- SUITABLE FOR AUTOPROTECTED ALTERNATOR ENVIRONMENT.
- BREAKDOWN VOLTAGE : 24 V min.
- CLAMPING VOLTAGE :  $\pm 40$  V max.
- MONOLITHIC STRUCTURE FOR GREATER RELIABILITY.

### DESCRIPTION

Designed to protect against battery reversal and overvoltages in automotive applications, this monolithic component offers multiple functions in the same package :

D1 : reversed battery protection

T1 : clamping against negative overvoltages

T2 : Transil function for overvoltage protection.

PRODUCT DESCRIPTION

The RBO has 3 functions integrated on the same chip.

D1 : "Diode function" in order to protect against reversed battery operation.

T2 : "Transil function" in order to protect against positive surge generated by electric systems (ignition, relay. ...).

T1 : Protection against negative surges such as inductive overvoltages (see motor application below).

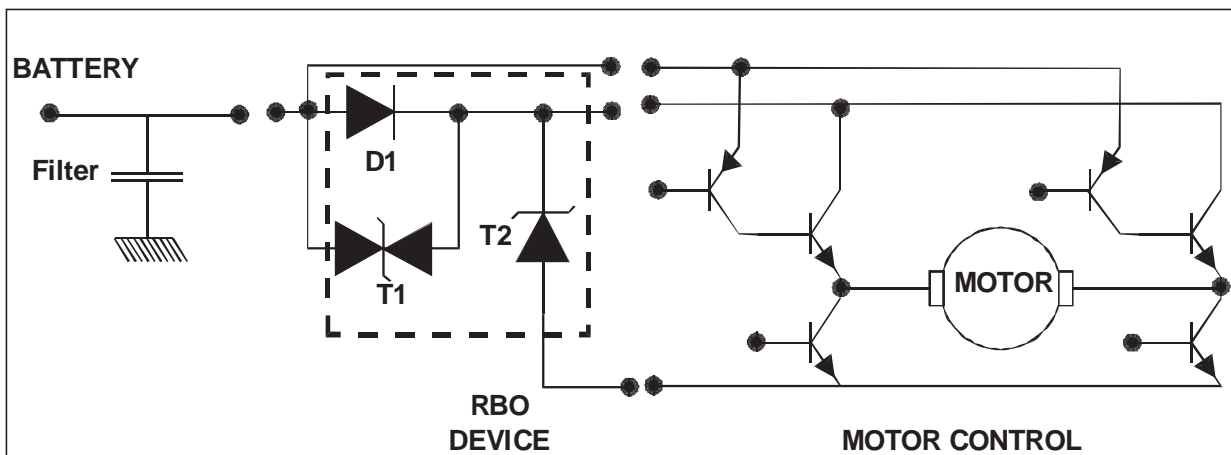

BASIC APPLICATION

\* The monolithic multi-function protection (RBO) has been developed to protect sensitive semiconductors in car electronic modules against both overvoltage and battery reverse.

\* In addition, the RBO circuit prevents overvoltages generated by the module from affecting the car supply network.

MOTOR DRIVER APPLICATION

In this application, one half of the motor drive circuit is supplied through the "RBO" and is thus protected as per its basic function application.

The second part is connected directly to the "car supply network" and is protected as follows :

- For positive surges : T2 (clamping phase) and D1 in forward-biased.
- For negative surges : T1 (clamping phase) and T2 in forward-biased.
