LSM330

iNEMO inertial module: 3D accelerometer and 3D gyroscope

Datasheet — target specification

Features

- Analog supply voltage: 2.4 V to 3.6 V
- Digital supply voltage IOs: 1.8 V
- Power-down and sleep modes
- 2 Embedded programmable state machines
- 3 independent acceleration channels and 3 angular rate channels
- ±2 *g*/±4 *g*/±6 *g*/±8 *g*/±16 *g* selectable full scale
- ±250/±500/±2000 dps selectable full scale
- SPI/I^2C serial interface
- Embedded Temperature Sensor
- Embedded FIFOs
- ECOPACK® RoHS and “Green” compliant

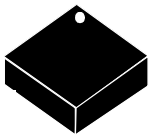
Application

- GPS navigation systems
- Impact recognition and logging
- Gaming and virtual reality input devices
- Motion activated functions
- Intelligent power saving for handheld devices
- Vibration monitoring and compensation
- Free-fall detection
- 6D orientation detection

Description

The LSM330 is a system-in-package featuring a 3D digital accelerometer with two embedded state machines that can be programmed to implement autonomous applications and a 3D digital gyroscope.

ST’s family of MEMS sensor modules leverages the robust and mature manufacturing processes already used for the production of micromachined accelerometers and gyroscopes.



LGA-24L (3x3.5x1 mm)

The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using a CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the sensing element characteristics.

The LSM330 has an user-selectable full scale acceleration range of ±2 *g*/±4 *g*/±6 *g*/±8 *g*/±16 *g* and angular rate range of ±250/±500/±2000 d.The accelerometer and gyroscope sensors can be either activated or separately put in Power-down/ sleep mode for applications optimized for power saving.

The LSM330 is available in a plastic land grid array (LGA) package.

Table 1. Device summary

Part number	Temperature range [°C]	Package	Packing
LSM330	-40 to +85	LGA-24L (3x3.5x1mm)	Tray
LSM330TR	-40 to +85		Tape and reel

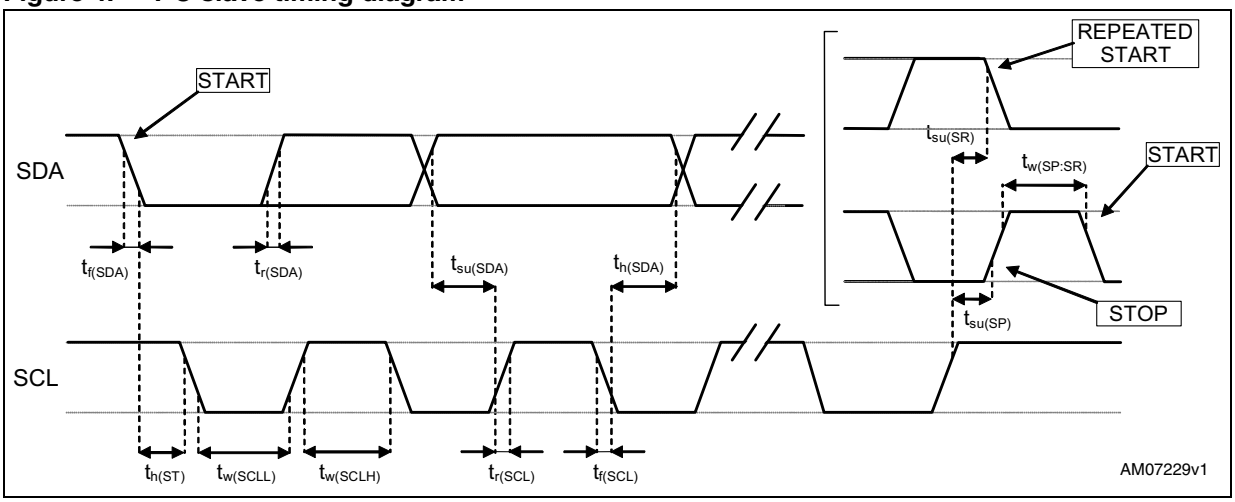
2. Cb = total capacitance of one bus line, in pF

Figure 4. I²C slave timing diagram(d)



d. Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both ports.

2.5 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 8. Absolute maximum ratings(1)

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to 4.8	V
Vdd_IO	I/O pins supply voltage	-0.3 to 4.8	V
Vin	Input voltage on any control pin (SCL_A/G, SDA_A/G, SDO_A, SDO_G, CS_A, CS_G, DEN_G)	-0.3 to Vdd_IO +0.3	V
A_{POW}	Acceleration (any axis, powered, Vdd = 3 V)	3000 *g* for 0.5 ms	
		10000 *g* for 0.1 ms	
A_{UNP}	Acceleration (any axis, unpowered)	3000 *g* for 0.5 ms	
		10000 *g* for 0.1 ms	
T_{OP}	Operating temperature range	-40 to +85	°C
T_{STG}	Storage temperature range	-40 to +125	°C
ESD	Electrostatic discharge protection	2 (HBM)	kV

1. Supply voltage on any pin should never exceed 4.8 V.

This is a mechanical shock sensitive device, improper handling can cause permanent damage to the part.

This is an ESD sensitive device, improper handling can cause permanent damage to the part.

3 Terminology

3.1 Sensitivity

Linear acceleration sensitivity can be determined e.g. by applying 1 *g* acceleration to the device. Because the sensor can measure DC accelerations, this can be done easily by pointing the selected axis towards the ground, noting the output value, rotating the sensor 180 degrees (pointing towards the sky) and noting the output value again. By doing so, ±1 *g* acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and over time. The sensitivity tolerance describes the range of sensitivities of a large number of sensors.

Angular Rate Sensitivity describes the angular rate gain of the sensor and can be determined by applying a defined angular velocity to the device. This value changes very little overtemperature and also very little overtime.

3.2 Zero-*g* and zero rate level

Linear acceleration zero-*g* level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface will measure 0 *g* on both the X axis and Y axes, whereas the Z axis will measure 1 *g*. Ideally, the output is in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as 2's complement number). A deviation from the ideal value in this case is called zero-*g* offset.

Offset is to some extent a result of stress to MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Linear acceleration zero-*g* level change vs. temperature" in *Table 3*. The zero-*g* level tolerance (TyOff) describes the standard deviation of the range of zero-*g* levels of a group of sensors.

Angular rate zero-rate level describes the actual output value if there is no angular rate present. zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and therefore zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little overtemperature and overtime.

4 Functionality

The LSM330 is a system-in-package featuring a 3D digital accelerometer with two embedded state machines and a 3D digital gyroscope, together with two FIFO memory block available to manage linear acceleration and angular rate data.

The device includes specific sensing elements and two IC interfaces capable to measuring both the acceleration and angular rate applied to the module and to provide a signal to external applications through an SPI/I^2C serial interface.

The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using a CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the sensing element characteristics.

4.1 Power modes

The linear acceleration sensor and the angular rate sensor can be either activated or separately set in Power-down/ sleep mode for applications optimized for power saving.

The acceleration sensor operating modes can be selected between normal or power-down trough the *CTRL_REG5_A (20h)*; the angular rate sensor operating mode can be selected among normal power-down or sleep mode, through *CTRL_REG1_G (20h)*.

4.2 Linear acceleration sensor digital main blocks

4.2.1 State machine

The LSM330 embeds two state machines able to run a user defined program.

The program is composed by a set of instructions that define the transition to successive states. Conditional branches are possible.

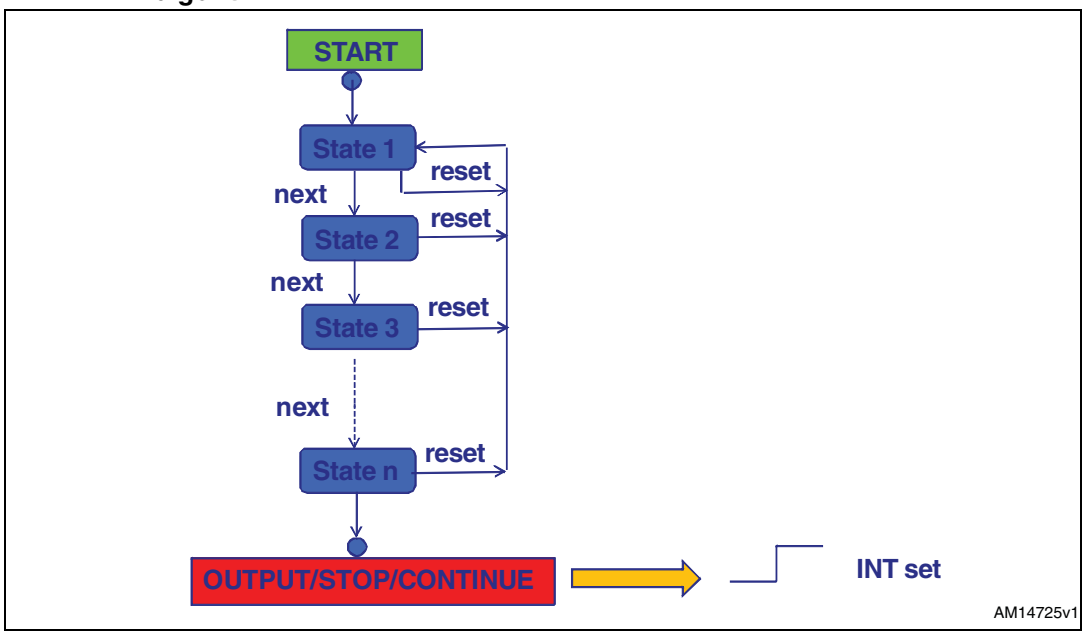
From each state (n) it is possible to have transition to next state (n+1) or to reset state. Transition to Reset Point happens when “RESET condition” is true; Transition to next step happens when “NEXT condition” is true.

Interrupt is triggered when Output/Stop/Continue state is reached.

Each State machine allows to implement in a flexible way gesture recognition, Free Fall, Wake-up, 4D/6D orientation, pulse counter and step recognition, click/double click, shake/double shake, face up/face down, turn/double turn:

- Code and parameters are loaded by host into dedicated memory areas for the state program
- State program with timing based on ODR or decimated time
- Possibiliy of conditional branches

Table 9. LSM330 accelerometer state machines: sequence of state to execute an algorithm



4.2.2 FIFO

LSM330 embeds 32 slots of data FIFO for each of the three acceleration output

channels: X, Y and Z. This allows consistent power saving for the system, since the host processor does not need to continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO. In order to use FIFO it is necessary to enable FIFO_EN bit in *CTRL_REG7_A (25h)* register.

FIFO buffer can work accordingly in five different modes: Bypass mode, FIFO mode, Stream mode, Stream-to-FIFO mode and Bypass-to-Stream mode. Each mode is selected by FMODE [2:0] bits in the *FIFO_CTRL_REG_A (2Eh)* register. Programmable watermark level, FIFO empty or FIFO overrun events can be enabled to generate dedicated interrupts on the INT1_A/INT2_A pin (configured through INT2_EN and INT1_EN bits in the *CTRL_REG4_A (23h)* register).

When FIFO is empty, EMPTY bit in *FIFO_SRC_REG_A (2Fh)* is equal to '1' and no samples are available.

If the application requires a lower number of samples a programmable watermark level can be set. In *FIFO_SRC_REG_A (2Fh)* WTM bit is high if a new data arrives and FSS [4:0] bit in *FIFO_SRC_REG_A (2Fh)* is greater than or equal to WTMP [4:0] bit in *FIFO_CTRL_REG_A (2Eh)* register. In *FIFO_SRC_REG_A (2Fh)* WTM bit goes to '0' if reading X, Y, Z data slot from FIFO and FSS [4:0] bit in *FIFO_SRC_REG_A (2Fh)* is minor than or equal to WTMP [4:0] bit in *FIFO_CTRL_REG_A (2Eh)* register.

When FIFO is completely filled, OVRN_FIFO bit in *FIFO_SRC_REG_A (2Fh)* is equal to '1' and FIFO slot is overwritten.

4.2.3 Bypass mode

In Bypass mode, the FIFO is not operational and it remains empty. For each channel only the first address is used. The remaining FIFO slots are empty.

Bypass mode must be used in order to reset the FIFO buffer when a different mode is operating (i.e. FIFO mode).

4.2.4 FIFO mode

In FIFO mode, the buffer continues filling data from the X, Y and Z accelerometer channels until it is full (32 samples set stored). When the FIFO is full it stops collecting data from the input channels and the FIFO content remains unchanged.

An overrun interrupt can be enabled, P1_OVERRUN = '1' in *CTRL_REG7_A (25h)* register, in order to be raised when the FIFO stops collecting data. When overrun interrupt occurs, the first data has been overwritten and the FIFO stops collecting data from the input channels.

At the end of the reading procedure it is necessary to transit from Bypass mode to reset FIFO content. . After this reset command it is possible to restart FIFO mode writing FMODE [2:0] the value '001' in *FIFO_CTRL_REG_A (2Eh)* register.

FIFO buffer can memorize 32 X, Y and Z data but the depth of the FIFO can be reduced by a programmable watermark. In order to enable FIFO watermark, WTM_EN bit in *CTRL_REG7_A (25h)* is high and the FIFO depth is set in WTMP [4:0] bits in *FIFO_CTRL_REG_A (2Eh)* register. The watermark interrupt can be enable in INT1_A pad if P1_WTM bit in *CTRL_REG7_A (25h)* register is enable.

4.2.5 Stream mode

In Stream mode FIFO continues filling data from X, Y, and Z accelerometer channels, when the buffer is full (32 samples set stored) the FIFO buffer index restarts from the beginning and older data is replaced by the current. The oldest values continue to be overwritten until a read operation makes free FIFO slots available.

An overrun interrupt can be enabled, P1_OVERRUN = '1' in *CTRL_REG7_A (25h)* register, in order to read the whole FIFO content at once. If in the application it is mandatory not to lose data and it is not possible to read at least one sample for each axis within one ODR period, a watermark interrupt can be enabled in order to read partially the FIFO and let free memory slots for data incoming.

Setting the WTMP [4:0] bit in *FIFO_CTRL_REG_A (2Eh)* register to N value, the number of X, Y and Z data samples that should be read at watermark interrupt rising is up to (N+1).

In the latter case reading all FIFO content before an overrun interrupt has occurred, the first data read is equal to the last already read in previous burst, so the number of new data available in FIFO depends on previous reading (see *FIFO_SRC_REG_A (2Fh)*) .

At the end of the reading procedure it is necessary to transit from Bypass mode to reset FIFO content.

4.2.6 Stream-to-FIFO mode

In Stream-to-FIFO mode FIFO behavior changes according to interrupt generated by the configuration of the two state machine by INT_SM1and INT_SM2 bits in *STAT (18h)* register.

When INT_SM1, INT_SM2 bits in *STAT (18h)* register are equal to '1' FIFO operates in FIFO mode, when INT_SM1, INT_SM2 bit in *STAT (18h)* register are equal to '0' FIFO operates in Stream mode.

4.2.7 Bypass-to-stream mode

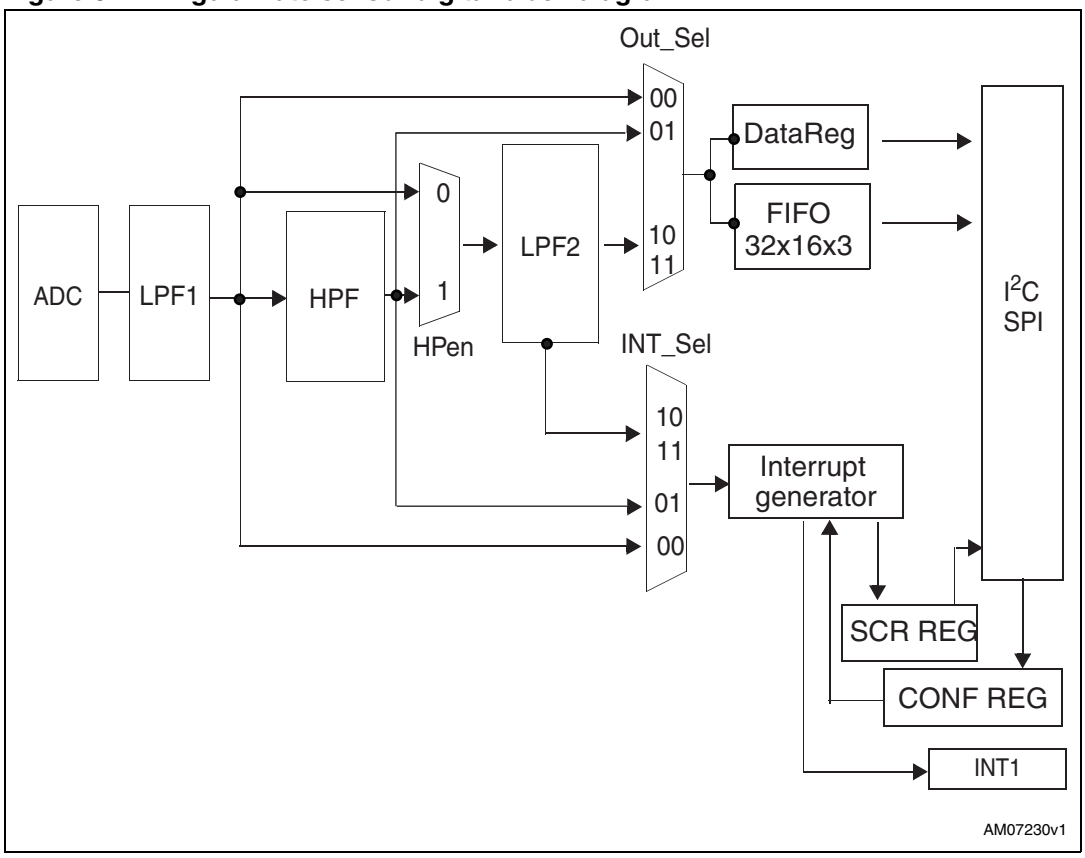
In Bypass-to-stream mode, the FIFO starts operating in Bypass mode and once a trigger event occurs (*STAT (18h)* the FIFO starts operating in Stream mode.

4.2.8 Retrieve data from FIFO

FIFO data is read through *OUT_X_L_A (28h) and OUT_X_H_A (29h)*, *OUT_Y_L_A (2Ah) and OUT_Y_H_A (2Bh)* and *OUT_Z_L_A (2Ch) and OUT_Z_H_A (2Dh)*. When the FIFO is in Stream, Trigger or FIFO mode, a read operation to the *OUT_X_L_A (28h) and OUT_X_H_A (29h)*, *OUT_Y_L_A (2Ah) and OUT_Y_H_A (2Bh)* or *OUT_Z_L_A (2Ch) and OUT_Z_H_A (2Dh)* registers provides the data stored in the FIFO. Each time data is read from the FIFO, the oldest X, Y and Z data are placed in the *OUT_X_L_A (28h) and OUT_X_H_A (29h)*, *OUT_Y_L_A (2Ah) and OUT_Y_H_A (2Bh)* and *OUT_Z_L_A (2Ch) and OUT_Z_H_A (2Dh)* registers and both single read and read_burst operations can be used.

4.3 Angular rate sensor digital main blocks

Figure 5. Angular rate sensor digital block diagram



4.3.1 FIFO

LSM330 embeds a 32 slots of 16 bit data FIFO buffer for each of the three output channels, yaw, pitch and roll. This allows a consistent power saving for the system, since the host processor does not need to continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

In order to use FIFO it is necessary to enable FIFO_EN bit in *CTRL_REG5_G (24h)* register. FIFO buffer can work accordingly to five different modes: Bypass mode, FIFO mode, Stream mode, Bypass-to-Stream mode and Stream-to-FIFO mode. Each mode is selected by the FM[2:0] bits into the *FIFO_CTRL_REG_G (2Eh)* register.

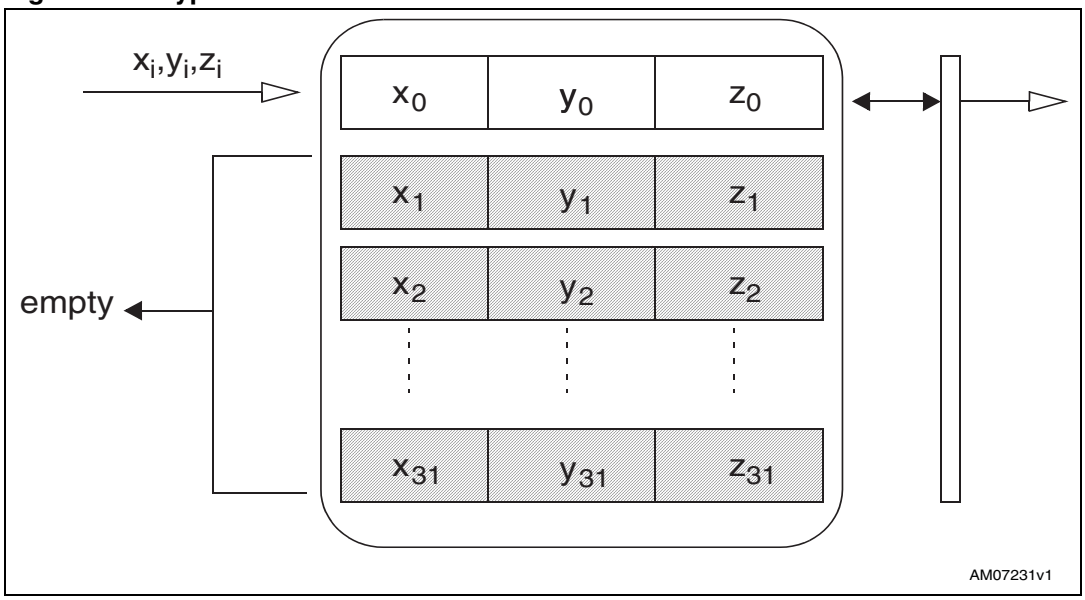
Programmable watermark level, FIFO empty or FIFO full events can be enabled to generate dedicated interrupts on DRDY_G/INT2_G pin (configuration through *CTRL_REG3_G (22h)*) and event detection information are available into *FIFO_SRC_REG_G (2Fh)*. Watermark level can be configurated to WTM[4:0] bits into *FIFO_CTRL_REG_G (2Eh)*.

4.3.2 Bypass mode

In bypass mode, the FIFO is not operational and for this reason it remains empty. As

described in the next figure, for each channel only the first address is used. The remaining FIFO slots are empty. When a new data is available the old one is overwritten.

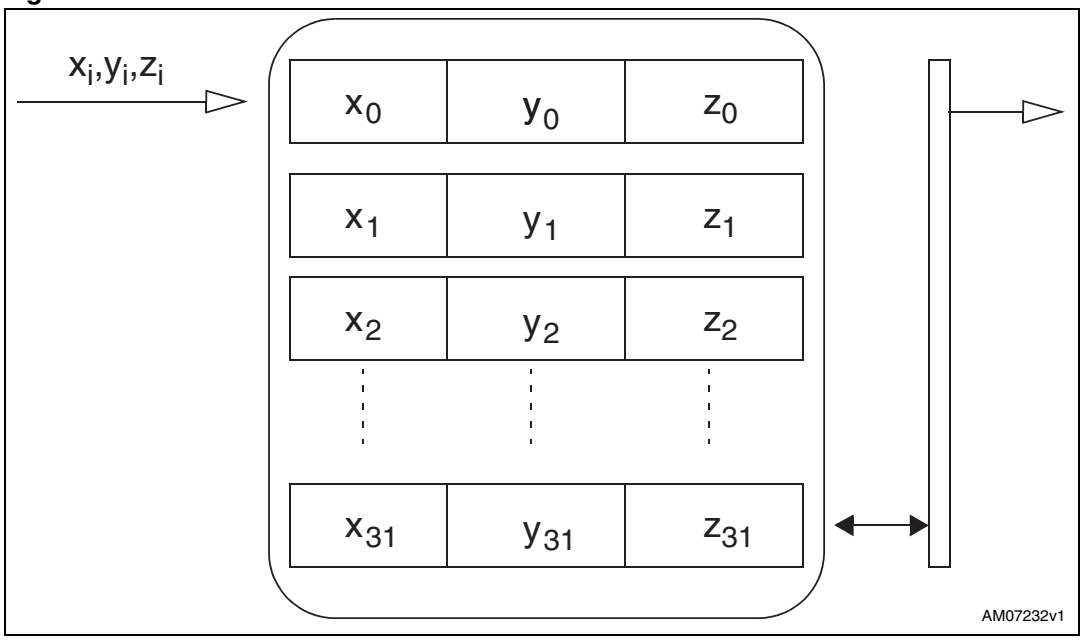
Figure 6. Bypass mode



4.3.3 FIFO mode

In FIFO mode, data from yaw, pitch and roll channels are stored into the FIFO. A watermark interrupt can be enabled (I2_WTM bit into *CTRL_REG3_G (22h)*) in order to be raised when the FIFO is filled to the level specified into the WTM[4:0] bits of *FIFO_CTRL_REG_G (2Eh)* register. The FIFO continues filling until it is full (32 slots of 16 data for Yaw, Pitch and Roll). When full, the FIFO stops collecting data from the input channels. To restart collecting data it is needed to write *FIFO_CTRL_REG_G (2Eh)* back to Bypass mode. FIFO mode is represented in the following figure.

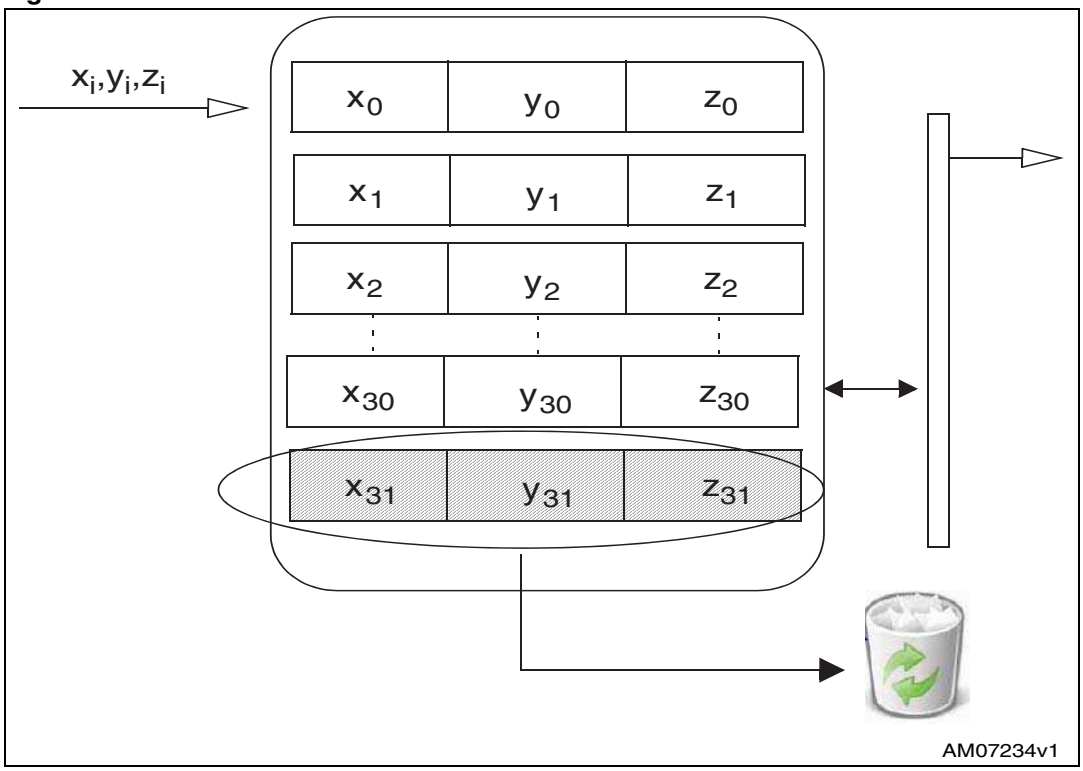
Figure 7. FIFO mode



4.3.4 Stream mode

In the stream mode, data from yaw, pitch and roll measurement are stored into the FIFO. A watermark interrupt can be enabled and set as in the FIFO mode. FIFO continues filling until it is full (32 slots of 16 data for Yaw, Pitch and Roll). When full, the FIFO discards the older data as the new arrive. Programmable watermark level events can be enabled to generate dedicated interrupts on DRDY_G/INT2_G pin (configuration through *CTRL_REG3_G (22h)*). Stream mode is represented in the following figure.

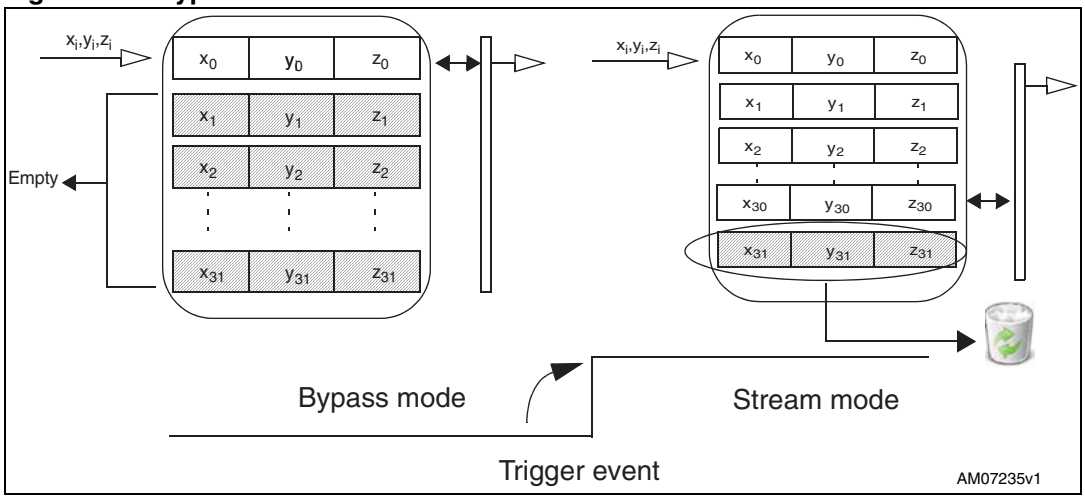
Figure 8. Stream mode



4.3.5 Bypass-to-stream mode

In Bypass-to-stream mode, the FIFO starts operating in Bypass mode and once a trigger event occurs (related to *INT1_CFG_G (30h)* register events) the FIFO starts operating in Stream mode. Refer the following figure.

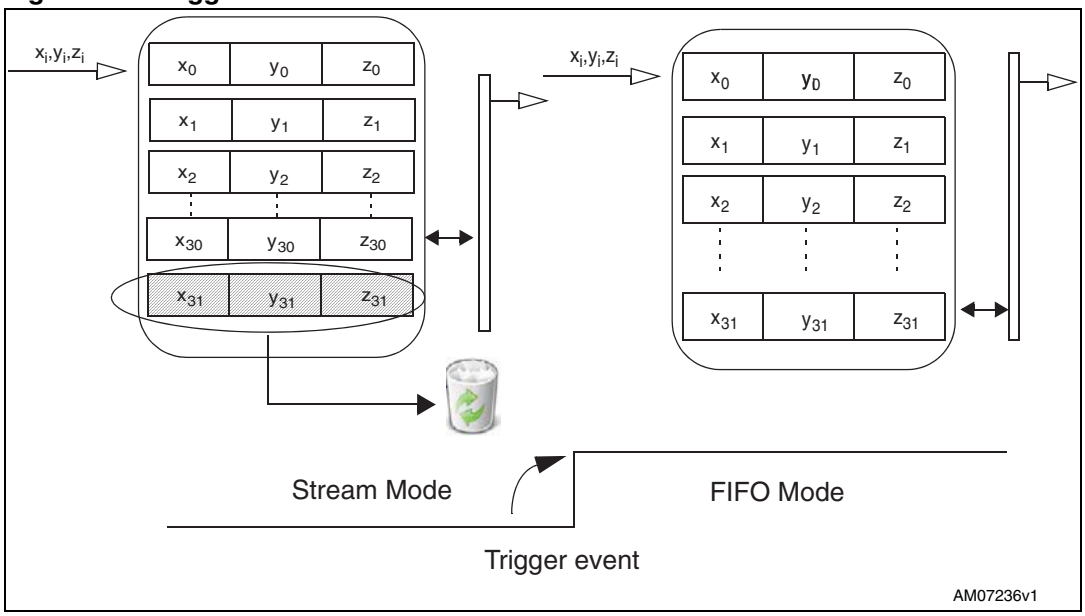
Figure 9. Bypass-to-stream mode



4.3.6 Stream-to-FIFO mode

In Stream-to-FIFO mode, data from yaw, pitch and roll measurement are stored into the FIFO. A watermark interrupt can be enabled on pin DRDY_G/INT2_G setting I2_WTM bit into *CTRL_REG3_G (22h)* in order to be raised when the FIFO is filled to the level specified into the WTM [4:0] bits of *FIFO_CTRL_REG_G (2Eh)*. The FIFO continues filling until it's full (32 slots of 16 data for Yaw, Pitch and Roll). When full, the FIFO discards the older data as the new arrive. Once trigger event occurs (related to *INT1_CFG_G (30h)* register events), the FIFO starts operating in FIFO mode. Refer to the following figure.

Figure 10. Trigger stream mode



4.3.7 Retrieve data from FIFO

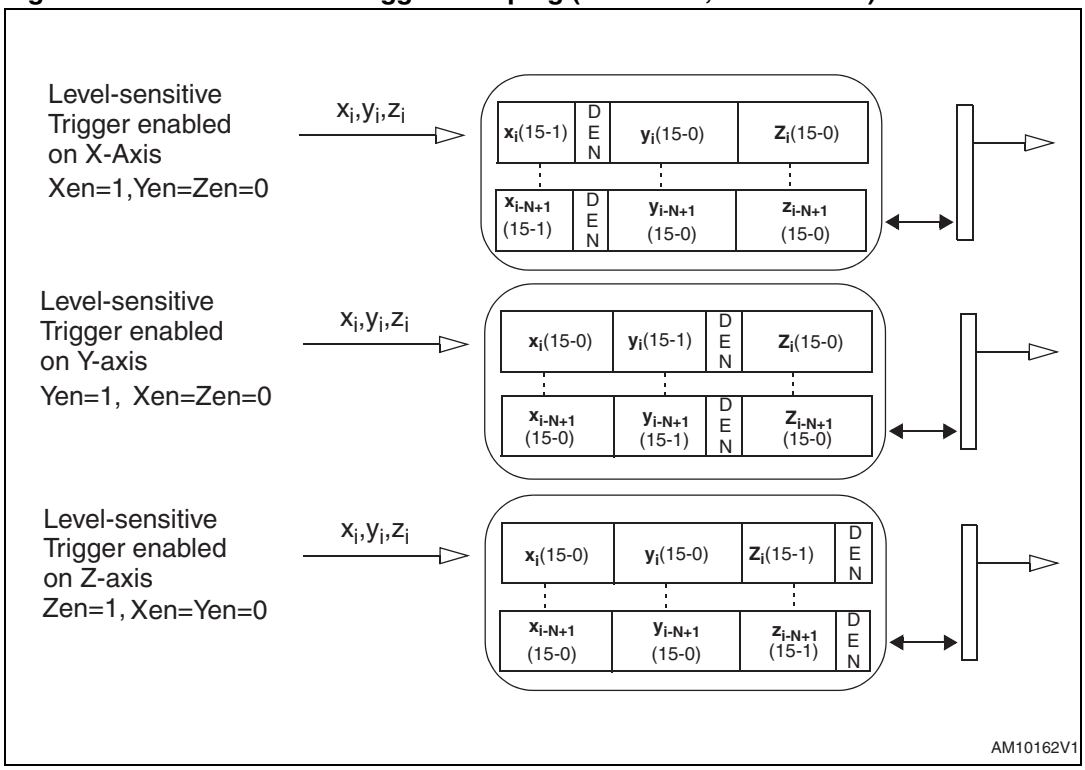
FIFO data is read through *OUT_X_L_G (28h), OUT_X_H_G (29h)* and *OUT_Y_L_G (2Ah), OUT_Y_H_G (2Bh)* and *OUT_Z_L_G (2Ch), OUT_Z_H_G (2Dh)*. When the FIFO is in stream, stream-to-FIFO or FIFO mode, a read operation to the *OUT_X_L_G (28h), OUT_X_H_G (29h)*, *OUT_Y_L_G (2Ah), OUT_Y_H_G (2Bh)* and *OUT_Z_L_G (2Ch), OUT_Z_H_G (2Dh)* regiters provides the data stored into the FIFO.

Each time data is read from the FIFO, the oldest Pitch, Roll and Yaw data are placed into the *OUT_X_L_G (28h), OUT_X_H_G (29h)*, *OUT_Y_L_G (2Ah), OUT_Y_H_G (2Bh)* and *OUT_Z_L_G (2Ch), OUT_Z_H_G (2Dh)* registers and both single read and read_burst (X, Y and Z with autoincremental address) operations can be used. When data included into OUT_Z_H_G (2Dh) is read, the system restarts to read information from OUT_X_L_G (28h).

4.3.8 Level-sensitive / edge-sensitive data enable

The LSM330 allows external trigger level recognition through the enabling of the EXTRen and LVLen bits in the *CTRL_REG2_G register*. Two different modes can be used: Level-sensitive or Edge-sensitive trigger.

Figure 11. Level-sensitive trigger stamping (LVLen = 1; EXTRen = 0)



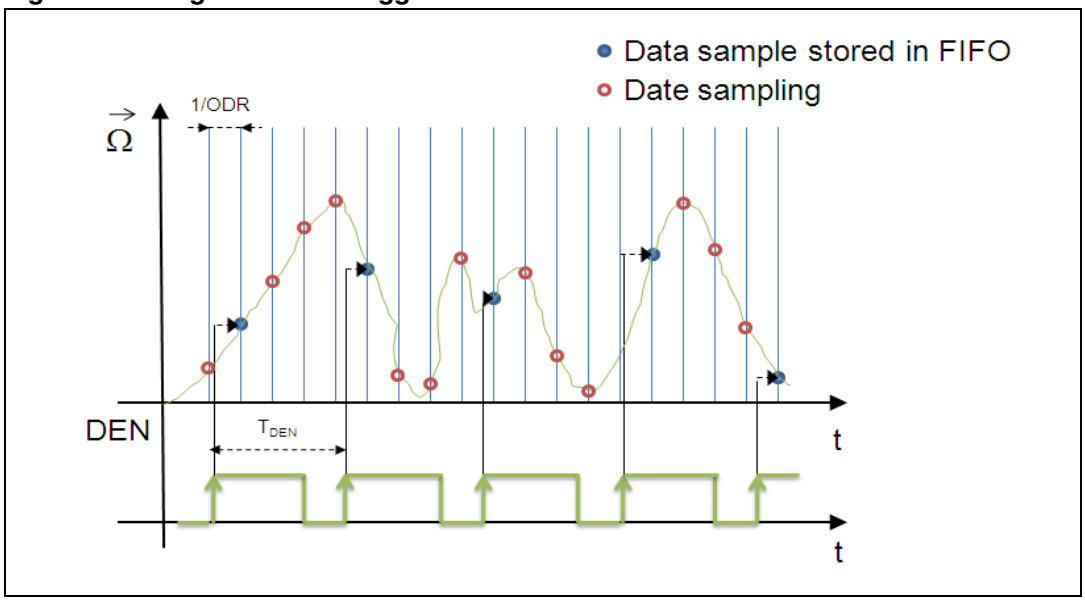
4.3.9 Level-sensitive trigger stamping

Once enabled, DEN level replaces the LSb of the X, Y or Z axes, configurable through the Xen, Yen, Zen bits in the *CTRL_REG1_G register*. Data is stored in the FIFO with the internally-selected ODR.

4.3.10 Edge-sensitive trigger

Once enabled by setting EXTRen = 1, FIFO is filled with the pitch, roll and yaw data on the rising edge of the DEN input signal. When selected ODR is 800 Hz, the maximum DEN sample frequency is $f_{DEN} = 1/T_{DEN} = 400$ Hz.

Figure 12. Edge-sensitive trigger

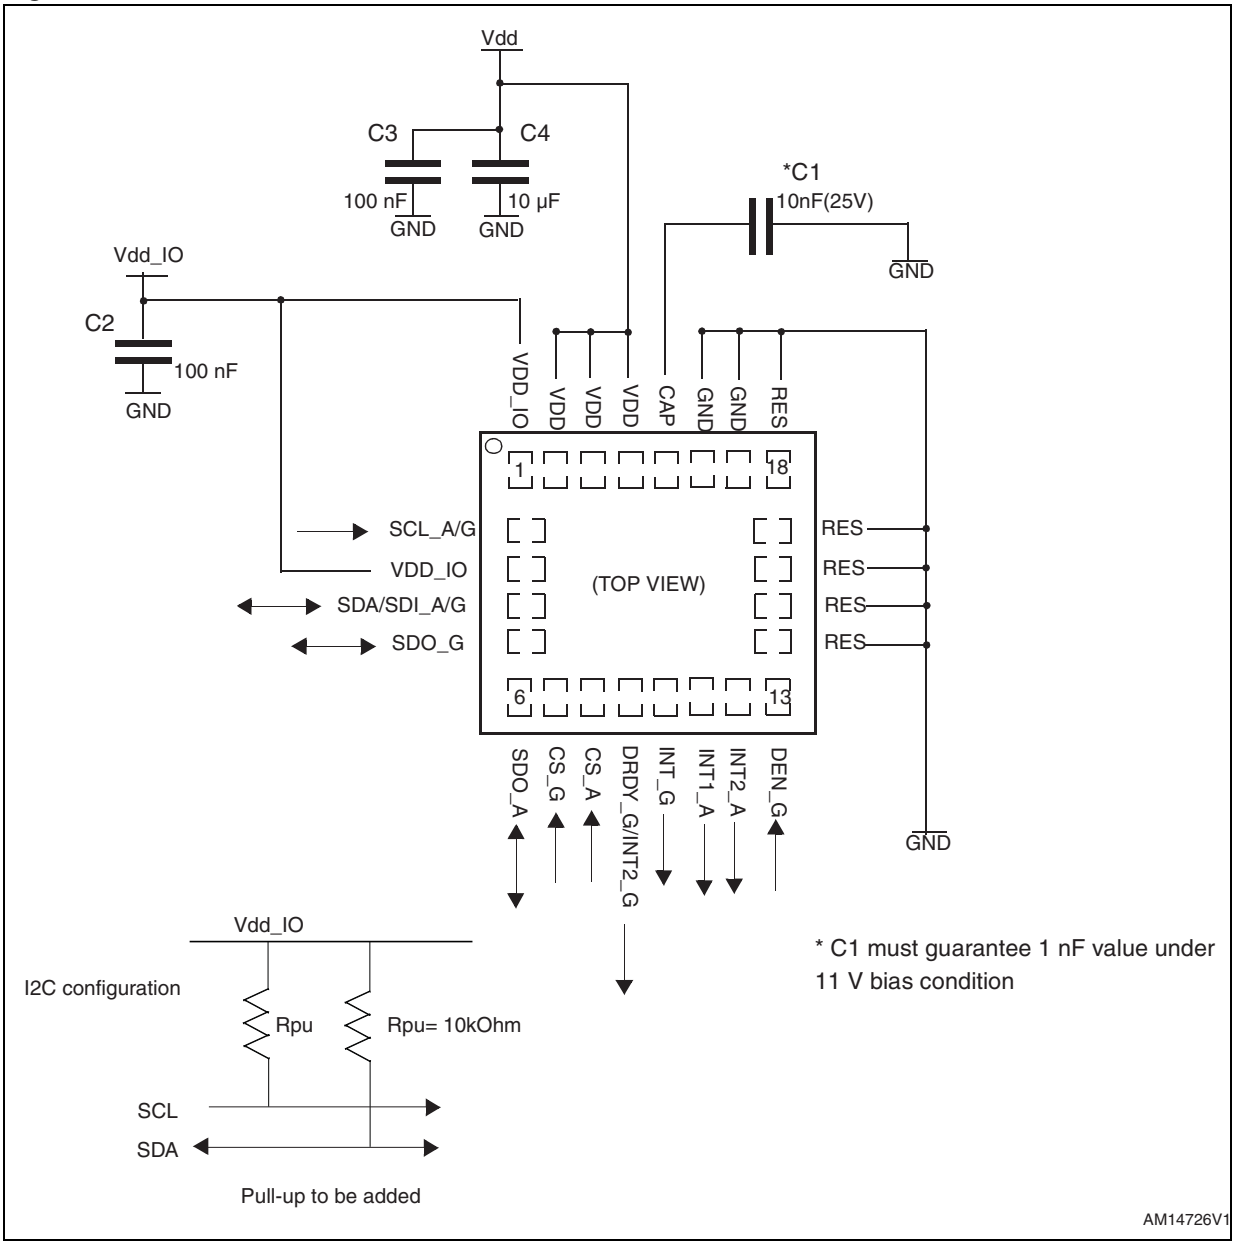


4.4 Factory calibration

The IC interface is factory calibrated for sensitivity and zero level. The trimming values are stored in the device in non volatile memory. Any time the device is turned on, the trimming parameters are downloaded to the registers to be used during normal operation. This allows use of the device without further calibration.

5 Application hints

Figure 13. LSM330 electrical connection



5.1 External capacitors

The device core is supplied through the Vdd line. Power supply decoupling capacitors (C2, C3=100 *nF* ceramic, C4=10 *µF* Al) should be placed as near as possible to the supply pin of the device (common design practice).

All voltage and ground supplies must be present at the same time to achieve proper behavior of the IC (refer to *Figure 13*).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I^{2}C interface.

The functions, the threshold and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I^{2}C interface.

5.2 Soldering information

The LGA package is compliant with ECOPACK®, RoHS and “Green” standards. It is qualified for soldering heat resistance according to JEDEC J-STD-020D.

Leave “Pin 1 Indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at www.st.com/mems.

6 Digital interfaces

The registers embedded in the LSM330 may be accessed through both the I^2C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode.

To select/exploit the I^2C interface, the CS line must be tied high (i.e. connected to Vdd_IO).

Table 10. Serial interface pin description

Pin name	Pin description
CS_A	Linear acceleration SPI enable Linear acceleration I^2C/SPI mode selection (1: I^2C mode; 0: SPI enabled)
CS_G	Angular rate SPI enable Angular rate I^2C/SPI mode selection (1: I^2C mode; 0: SPI enabled)
SCL_A/G	I^2C serial clock (SCL) SPI serial port clock (SPC)
SDA_A/G	I^2C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
SDO_A SDO_G	I^2C least significant bit of the device address (SA0) SPI serial data output (SDO)

6.1 I^2C serial interface

The LSM330 I^2C is a bus slave. The I^2C is employed to write the data to the registers, whose content can also be read back.

The relevant I^2C terminology is provided in the table below.

Table 11. Serial interface pin description

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I^2C bus: the Serial Clock Line (SCL) and the Serial Data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface.

6.1.1 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a HIGH to LOW transition on the data line while the SCL line is held HIGH. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits, and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the HIGH period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded in the LSM330 behaves like a slave device and the following protocol must be adhered to. After the start condition (ST), a slave address is sent. Once a slave acknowledge (SAK) has been returned, an 8-bit sub-address (SUB) is transmitted: the 7 LSb represent the actual register address while the MSb enables address auto increment. If the MSb of the SUB field is '1', the SUB (register address) will be automatically increased to allow multiple data read/write.

Table 12. Transfer when master is writing one byte to slave

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

Table 13. Transfer when master is writing multiple bytes to slave

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

Table 14. Transfer when master is receiving (reading) one byte of data from slave

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

Table 15. Transfer when master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD+W		SUB		SR	SAD+R			MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DATA		DATA		

Data is transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes sent per transfer is unlimited. Data is transferred with the most significant bit (MSb) first. If a receiver cannot receive another complete byte of data until it has performed some other function, it can hold the clock line, SCL, LOW to force the transmitter into a wait state.

Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver does not acknowledge the slave address (i.e. it is not able to receive because it is performing some real-time function) the data line must be left HIGH by the slave. The master can then abort the transfer. A LOW to HIGH transition on the SDA line while the SCL line is HIGH is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to 1 while SUB(6-0) represents the address of first register to be read.

In the communication format presented, MAK is Master Acknowledge and NMAK is No Master Acknowledge.

Default address:

The **SDO**/**SA0** pins (SDO_A / SDO_G) can be used to modify the least significant bits of the device address.The linear acceleration sensor slave address is 00111xxb whereas the xx bits are modified by the SDO_A pin: If SDO/A pin is connected to voltage supply, the address is 0011101b otherwise if SDO/A pin is connected to ground, the address is 0011110b.This solution allows to connect and address two different accelerometers to the same I2C line.

The angular rate sensor slave address is 110101xb, whereas the x bit is modified by the SDO/G bit: If the SDO_G pin is connected to voltage supply, LSb is ‘1’ (address 1101011b), otherwise, if the SDO_G pin is connected to ground, the LSb value is ‘0’ (address 1101010b).

The slave addresses is completed with a Read/Write bit. If the bit was ‘1’ (Read), a repeated START (SR) condition will have to be issued after the two sub-address bytes; if the bit is ‘0’ (Write) the master will transmit to the slave with direction unchanged. *Table* and *Table 17* explain how the SAD+Read/Write bit pattern arecomposed, listing all the possible configurations.

Linear acceleration sensor: the default (factory) 7-bit slave address is 00111xxb.

Table 16. Linear acceleration SAD+Read/Write patterns

Command	SAD[6:2]	SAD[1] = $\overline{\text{SDO\_A}}$	SAD[0] = SDO_A	R/W	SAD+R/W
Read	00111	1	0	1	00111101 (3Dh)
Write	00111	1	0	0	00111100 (3Ch)
Read	00111	0	1	1	00111011 (3Bh)
Write	00111	0	1	0	00111010 (3Ah)

Angular rate sensor: the default (factory) 7-bit slave address is 110101xb.

Table 17. Angular rate SAD+Read/Write patterns

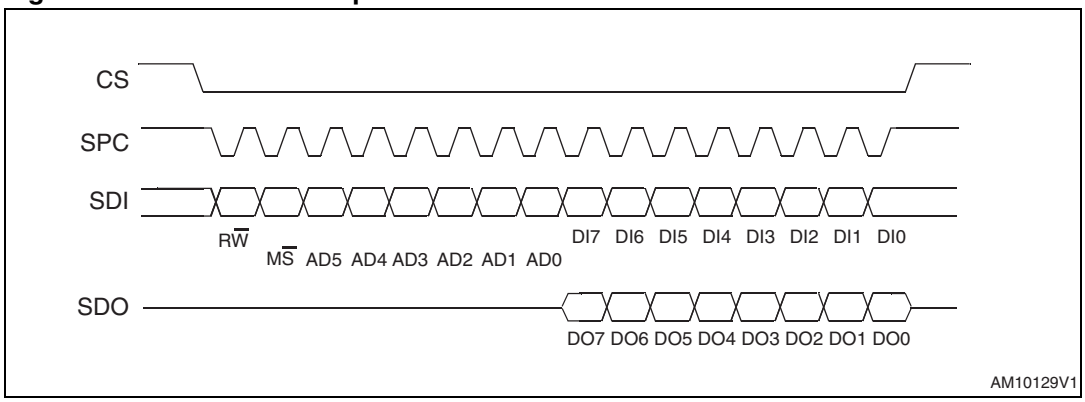
Command	SAD[6:1]	SAD[0] = SDO_G	R/W	SAD+R/W
Read	110101	0	1	11010101 (D5h)
Write	110101	0	0	11010100 (D4h)
Read	110101	1	1	11010111 (D7h)
Write	110101	1	0	11010110 (D6h)

6.2 SPI bus interface

The LSM330 SPI is a bus slave. The SPI allows writing and reading the registers of the device.

The serial interface interacts with the external world through 4 wires: **CS(CS_A,CS_G)**, **SPC**, **SDI** and **SDO (SDO_A,SDO_G);** (SPC, SDI are common).

Figure 14. Read and write protocol



CS is the serial port enable and is controlled by the SPI master. It goes low at the start of the transmission and returns high at the end. **SPC** is the serial port clock and is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are respectively the serial port data input and output. These lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple-byte read/write. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS**, while the last bit (bit 15, bit 23, ...) starts at the last falling edge of SPC just before the rising edge of **CS**.

bit 0: R$\overline{W}$ bit. When 0, the data DI(7:0) is written to the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip drives **SDO** at the start of bit 8.

bit 1: M$\overline{S}$ bit. When 0, the address remains unchanged in multiple read/write commands. When 1, the address is auto-incremented in multiple read/write commands.

bit 2-7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (Write mode). This is the data that will be written to the device (MSb first).

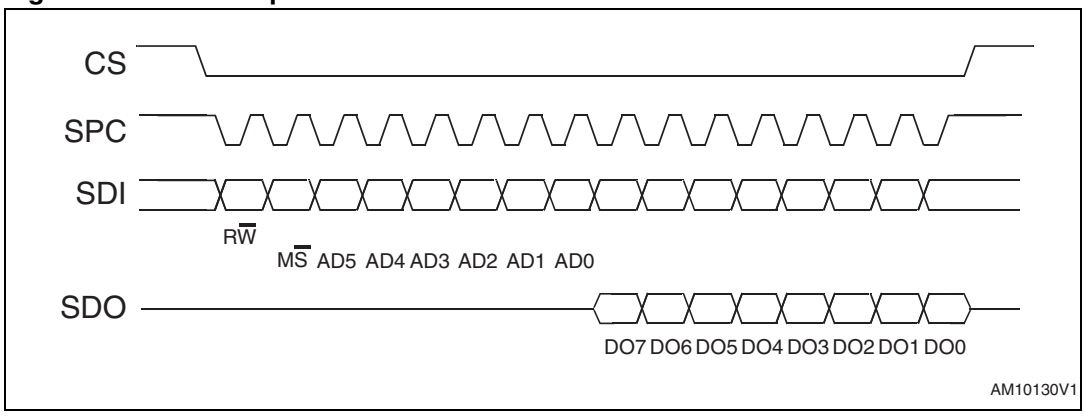
bit 8-15: data DO(7:0) (Read mode). This is the data that will be read from the device (MSb first).

In multiple read/write commands, further blocks of 8 clock periods will be added. When the MS bit is '0', the address used to read/write data remains the same for every block. When the MS bit is '1', the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

6.2.1 SPI read

Figure 15. SPI read protocol



Note: Data on CS, SPC, SDI and SDO refer to pins: CS_A, CS_G, SCL_A/G, SDA_A/G, SDO_A / SDO_G.

The SPI read command is performed with 16 clock pulses. A multiple-byte read command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: READ bit. The value is 1.

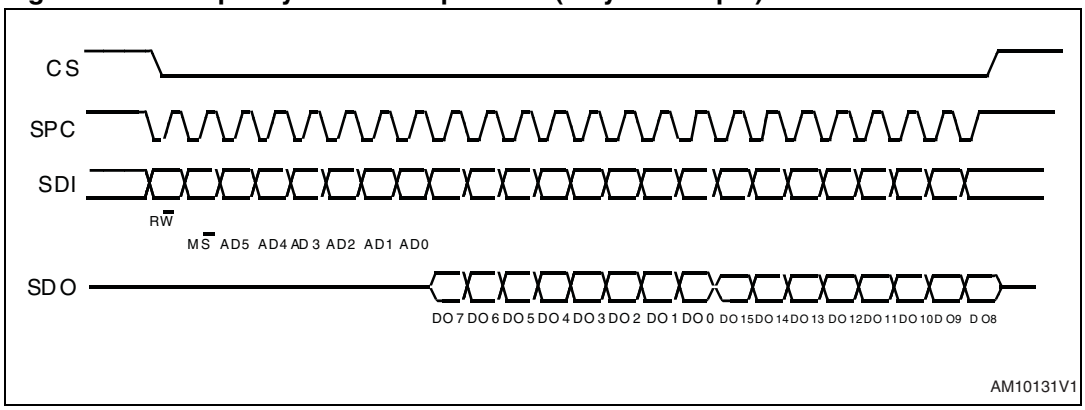
bit 1: MS bit. When 0, do not increment address; when 1, increment address in multiple reading.

bit 2-7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (Read mode). This is the data that will be read from the device (MSb first).

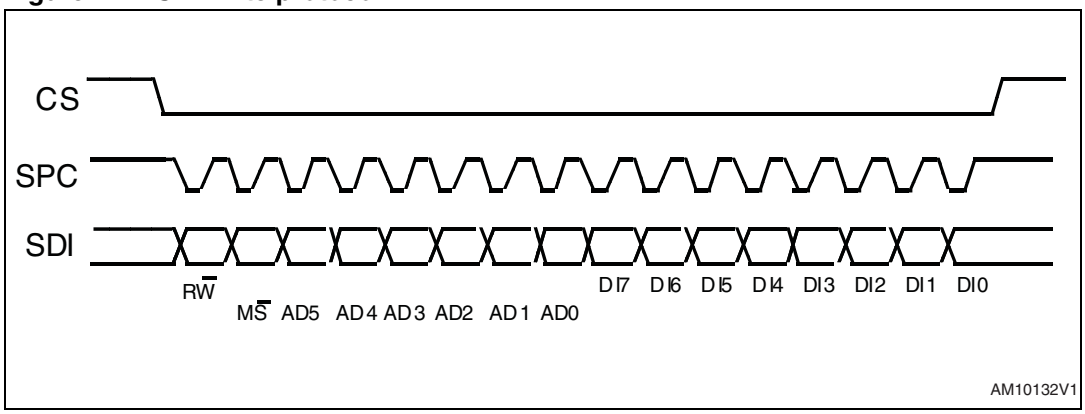
bit 16-... : data DO(...-8). Further data in multiple-byte reading.

Figure 16. Multiple-byte SPI read protocol (2-byte example)



6.2.2 SPI write

Figure 17. SPI write protocol



Note: Data on CS, SPC, SDI and SDO refer to pins: CS_A, CS_G, SCL_A/G, SDA_A/G, SDO_A / SDO_G.

The SPI write command is performed with 16 clock pulses. A multiple-byte write command is performed by adding blocks of 8 clock pulses to the previous one.

bit 0: WRITE bit. The value is 0.

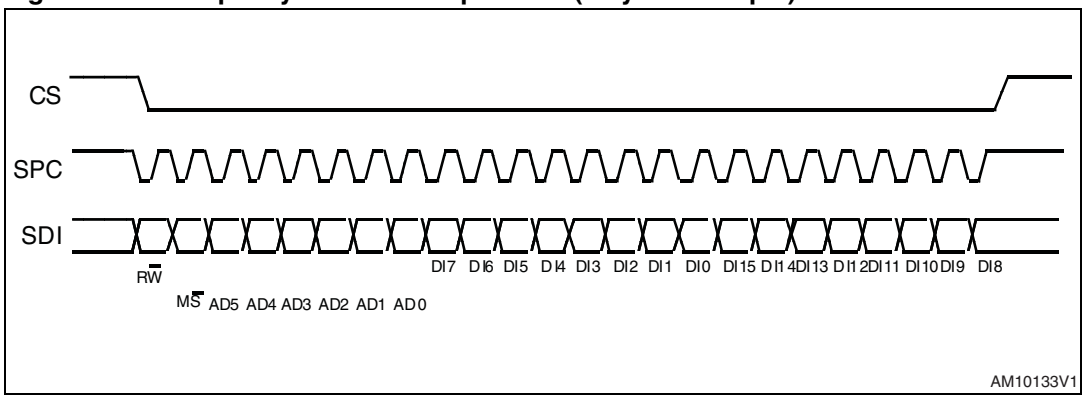
bit 1: M$\overline{S}$ bit. When 0, do not increment address; when 1, increment address in multiple writing.

bit 2 -7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (Write mode). This is the data that will be written to the device (MSb first).

bit 16-... : data DI(...-8). Further data in multiple-byte writing.

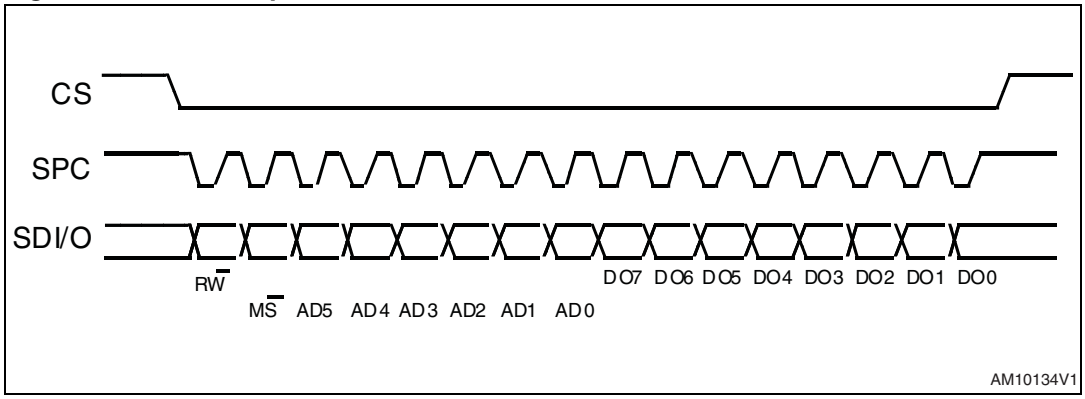
Figure 18. Multiple bytes SPI write protocol (2 bytes example)



6.2.3 SPI read in 3-wire mode

3-wire mode is entered by setting the SIM bits to '1' (SPI serial interface mode selection) in the *CTRL_REG6_A (24h)* and *CTRL_REG4_G (23h)* .

Figure 19. SPI read protocol in 3-wire mode



Note: Data on CS, SPC, SDI and SDO refer to pins: CS_A, CS_G, SCL_A/G, SDA_A/G, SDO_A / SDO_G.

The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1: MS bit. When 0, do not increment address; when 1, increment address in multiple reading.

bit 2-7: address AD(5:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (Read mode). This is the data that will be read from the device (MSb first).

Multiple read command is also available in 3-wire mode.

7 Register mapping

The table below provides a listing of the 8/16-bit registers embedded in the device, and their related addresses:

Table 18. Register address map

Registers marked as *Reserved* must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

8 Register descriptions

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration, angular rate and temperature data. The register addresses, made up of 7 bits, are used to identify them and to write the data through the serial interface.

VFILT	Vector Filter enable. Default Value:0 0 = Vector filter disabled, 1 = Vector filter enabled
STRT	Soft Reset bit. Default Value:0. 0= no soft reset, 1= Soft Reset (POR function)

8.3 CTRL_REG5_A (20h)

Linear acceleration sensor control register 5 (r/w)

Table 22. CTRL_REG5_A register

ODR3	ODR2	ODR1	ODR0	BDU	ZEN	YEN	XEN

Table 23. CTRL_REG5_A register description

ODR [3:0]	Output data rate & Power Mode selection. Default Value:0000 (see *Table 24*)
BDU	Block Data Update. Default Value:0 0:continuos update,1:output registers not updated until MSB and LSB reading
Zen	Z axis enable. Default Value:1 (0:Z axis disabled; 1:Z axis enabled)
Yen	Y axis enable. Default Value:1 (0:Y axis disabled; 1:Y axis enabled)
Xen	X axis enable. Default Value:1 (0:X axis disabled;1:X axis enabled)

ODR [3:0] is used to set Power mode, ODR selection . In the following *Table* are reported all frequencies available.

Table 24. CTRL_REG5_A Output Data Rate selection

ODR3	ODR2	ODR1	ODR0	ODR selection
0	0	0	0	Power Down
0	0	0	1	3.125 Hz
0	0	1	0	6.25 Hz
0	0	1	1	12.5 Hz
0	1	0	0	25 Hz
0	1	0	1	50 Hz
0	1	1	0	100 Hz
0	1	1	1	400 Hz
1	0	0	0	800 Hz
1	0	0	1	1600 Hz

BDU bit is used to inhibit output registers update until both upper and lower registers are read. In default mode (BDU='0') the output register values are updated continuosly. If for any reason it is not sure to read faster than output data rate it is recommended to set BDU bit to '1'. In this way the content of output register is not updated until both MSB and LSB are read, avoiding to read values related to different sample time.

8.4 CTRL_REG6_A (24h)

Linear acceleration sensor control register 6 (r/w).

Table 25. CTRL_REG6_A register

BW2	BW1	FSCALE2	FSCALE1	FSCALE0	-	-	SIM

Table 26. CTRL_REG6_A register description

BW [2:1]	Anti aliasing filter bandwidth. Default value: 00 00= 800 Hz; 01= 200 Hz; 10:=400 Hz; 11:=50 Hz)
FSCALE [2:0]	Full Scale selection. Default value: 000 000= +/- 2G; 001=+/- 4G; 010= +/- 6G; 011= +/- 8G; 100= +/- 16G
SIM	SPI Serial Interface Mode selection. Default value: 0 0= 4-wire interface; 1:=3-wire interface

8.5 CTRL_REG7_A (25h)

Linear acceleration sensor control register 7(r/w).

Table 27. CTRL_REG7_A register

BOOT	FIFO_EN	WTM_EN	ADD_ INC	P1_ EMPTY	P1_WTM	P1_OVER RUN	BOOT_ INT

Table 28. CTRL_REG7_A register description

BOOT	Force reboot, cleared as soon as the reboot is finished. Active High. Default value: 0
FIFO_EN	FIFO Enable. Default value: 0. 0= Disable; 1= Enable
WTM_EN	Enable FIFO Watermark level use. Default value: 0. 0= Disable; 1 = Enable
ADD_INC	Register address automatically incremented during a multiple byte access with a serial interface (I2C or SPI).Default value: 0 0=Disable; 1= Enable
P1_EMPTY	Enable FIFO Empty indication on INT1_A. Default value: 0. 0= Disable; 1= Enable
P1_WTM	FIFO Watermark interrupt on INT1_A. Default value: 0. 0:=Disable; 1= Enable
P1_OVERRUN	FIFO Overrun interrupt on INT1_A. Default value: 0. 0= Disable; 1= Enable
P2_BOOT	BOOT interrupt on INT2_A. Default value: 0. 0= Disable; 1= Enable

8.6 STATUS_REG_A (27h)

Linear acceleration sensor status register (r).

Table 29. STATUS_REG_A register

ZYXOR	ZOR	YOR	XOR	ZYXDA	ZDA	YDA	XDA

Table 30. STATUS_REG_A register description

ZYXOR	X, Y and Z axis Data Overrun. Default value: 0 0=no overrun has occurred; 1= a new set of data has overwritten the previous one
ZOR	Z axis Data Overrun. Default value: 0 0= no overrun has occurred; 1= a new set of data for the Z-axis has overwritten the previous one
YOR	Y axis Data Overrun. Default value: 0 0= no overrun has occurred; 1= a new data for the Y-axis has overwritten the previous one
XOR	X axis Data Overrun. Default value: 0 0= no overrun has occurred; 1= a new data for the X-axis has overwritten the previous one
ZYXDA	X, Y and Z axis new Data Available. Default value: 0 0= a new set of data is not yet available; 1= a new set of data is available
ZDA	Z axis new Data Available. Default value: 0 0= a new data for the Z-axis is not yet available; 1=a new data for the Z-axis is available
YDA	Y axis new Data Available. Default value: 0 0 = a new data for the Y-axis is not yet available; 1 = a new data for the Y-axis is available
XDA	X axis new Data Available. Default value: 0 0 = a new data for the X-axis is not yet available; 1 = a new data for the X-axis is available

8.7 OFF_X (10h)

Offset correction x-axis register, signed value (r/w).

Table 31. OFF_X default valu

0	0	0	0	0	0	0	0

8.8 OFF_Y (11h)

Offset correction y-axis register, signed value (r/w).

Table 32. OFF_Y default value

0	0	0	0	0	0	0	0

8.9 OFF_Z (12h)

Offset correction z-axis register, signed value (r/w).

Table 33. OFF_Z default value

0	0	0	0	0	0	0	0

8.10 CS_X (13h)

Constant shift signed value x-axis register (r/w).

Table 34. CS_X default value

0	0	0	0	0	0	0	1

8.11 CS_Y (14h)

Constant shift signed value y-axis register (r/w).

Table 35. CS_Y default value

0	0	0	0	0	0	0	1

8.12 CS_Z (15h)

Constant shift signed value z-axis register (r/w).

Table 36. CS_Z default value

0	0	0	0	0	0	0	1

8.13 LC_L (16h) and LC_H (17h)

16 bit long-counter register for interrupt state machine programs timing (r/w)

Table 37. LC_L default value

0	0	0	0	0	0	0	1

Table 38. LC_H default value

0	0	0	0	0	0	0	0

01h=counting stopped, 00h=counter full:interrupt available and counter is set to default values higher than 00h:counting

8.14 STAT (18h)

Interrupt Synchronization register (r).

Table 39. STAT register

LONG	SYNCW	SYNC1	SYNC2	INT_SM1	INT_SM2	DOR	DRDY

Table 40. STAT register description

LONG	LC interrupt flag. 0 = no interrupt, 1 = Long Counter (LC) interrupt flag common for both SM
SYNCW	Synchronization for external Host Controller Interrupt based on output data 0= no action waiting from host; 1= action from host based on output data
SYNC1	0 = SM1 running normally, 1 = SM1 stopped and wait restart request from SM2
SYNC2	0 = SM2 running normally, 1 = SM2 stopped and wait restart request from SM1
INT_SM1	SM1- Interrupt Selection. 1= SM1 interrupt generated;0 = SM1 interrupt not generated
NT_SM2	SM2- Interrupt Selection. 1= SM2 interrupt generated;0=SM2 interrupt not generated
DOR	Data overrun indicates not read data from output register when next data samples measure start ;0 = no overrun, 1 = data overrun data overrun bit is reset when next sample is ready
DRDY	data ready from output register. 0 = data not ready, 1 = data ready

8.15 VFC_1 (1Bh)

Vector coefficient register 1 for DIff filter (r/w).

Table 41. VFC_1 default value

0	0	0	0	0	0	0	0

8.16 VFC_2 (1Ch)

Vector coefficient register 2 for DIff filter (r/w).

Table 42. VFC_2 default value

0	0	0	0	0	0	0	0

8.17 VFC_3 (1Dh)

Vector coefficient register 3 for DIff filter (r/w).

Table 43. VFC_3 default value

0	0	0	0	0	0	0	0

8.18 VFC_4 (1Eh)

Vector coefficient register 4 for DIff filter (r/w).

Table 44. VFC_4 default value

0	0	0	0	0	0	0	0

8.19 THRS3 (1Fh)

Threshold value register (r/w).

Table 45. THRS3 default value

0	0	0	0	0	0	0	0

8.20 OUT_X_L_A (28h) and OUT_X_H_A (29h)

X-axis linear acceleration output data register (r). The value is expressed as two's complement.

8.21 OUT_Y_L_A (2Ah) and OUT_Y_H_A (2Bh)

Y-axis linear acceleration output data register (r). The value is expressed as two's complement.

8.22 OUT_Z_L_A (2Ch) and OUT_Z_H_A (2Dh)

X-axis linear acceleration output data register (r). The value is expressed as two's complement.

8.23 FIFO_CTRL_REG_A (2Eh)

linear acceleration sensor FIFO control register (r/w).

Table 46. FIFO_CTRL_REG_A register

FMODE2	FMODE1	FMODE0	WTMP4	WTMP3	WTMP2	WTMP1	WTMP0

Table 47. FIFO_CTRL_REG_A register description

FMODE [2:0]	FIFO mode selection. Default value: 000 (see *Table 48*)
WTMP [4:0]	FIFO threshold. Watermark level setting. FIFO depth if the watermark is enable

Table 48. FIFO mode configuration

FMODE2	FMODE1	FMODE0	FIFO Mode
0	0	0	Bypass mode
0	0	1	FIFO mode
0	1	0	Stream mode
0	1	1	Stream-to-FIFO mode
1	0	0	Bypass-to-Stream mode

Other configurations are not used.

8.24 FIFO_SRC_REG_A (2Fh)

Linear acceleration sensor FIFO source control register (r).

Table 49. FIFO_SRC_REG_A register

WTM	OVRN_ FIFO	EMPTY	FSS4	FSS3	FSS2	FSS1	FSS0

Table 50. IFO_SRC_REG_A register description

WTM	Watermark status. 0=FIFO filling is lower than WTM level; 1= FIFO filling is equal or higher than WTM level
OVRN_FIFO	Overrun bit status. 0=FIFO is not completely filled; 1=FIFO is completely filled
EMPTY	FIFO empty bit. 0= FIFO not empty; 1:=FIFO empty)
FSS [4:0]	FIFO stored data level

8.25 CTRL_REG2_A (21h)

State machine 1 control register (r/w).

Table 51. CTRL_REG2_A register

HYST2_1	HYST1_1	HYST0_1	-	SM1_PIN	-	-	SM1_EN

Table 52. CTRL_REG2_A register description

HYST2_1 HYST1_1 HYST0_1	Hysteresis unsigned value to be added or subtracted from threshold value in SM1 Default Value :000
SM1_PIN	0 = SM1 interrupt routed to INT1_A pin, 1 = SM1 interrupt routed to INT2_A pin Default Value :0
SM1_EN	0 = SM1 disabled, 1 = SM1 enabled Default Value :0

8.26 STx_1 (40h-4Fh)

State machine 1 code register (r/w).

State machine 1 system register is composed by 16, 8 bit registers, to implement 16 steps op-code (STx_1 (x = 1-16)).

Table 53. STx_1 registers default value

0	0	0	0	0	0	0	0

8.56 WHO_AM_I_G (0Fh)

Who am I angular rate sensor register (r)

Table 101. WHO_AM_I_G register

1	1	0	1	0	1	0	0

8.57 CTRL_REG1_G (20h)

Angular rate sensor control register 1 (r/w).

Table 102. CTRL_REG1_G register

DR1	DR0	BW1	BW0	PD	Zen	Xen	Yen

Table 103. CTRL_REG1_G description

DR [1:0]	Output data rate selection.Default value:00. Refer to *Table 104*
BW [1:0]	Bandwidth selection.Default value:00. Refer to *Table 104*
PD	Power-down mode enable. Default value: 0 (0: Power-down mode, 1: Normal mode or Sleep mode)
Zen	Z axis enable. Default value: 1 (0: Z axis disabled; 1: Z axis enabled)
Yen	Y axis enable. Default value: 1 (0: Y axis disabled; 1: Y axis enabled)
Xen	X axis enable. Default value: 1 (0: X axis disabled; 1: X axis enabled)

DR [1:0] is used to set ODR selection. **BW [1:0]** is used to set bandwidth selection.

The table below provides all the frequencies resulting from the DR / BW bit combinations.

Table 104. DR and BW configuration setting

DR [1:0]	BW [1:0]	ODR [Hz]	Cut-off [Hz](1)
00	00	95	12.5
00	01	95	25
00	10	95	25
00	11	95	25
01	00	190	12.5
01	01	190	25
01	10	190	50
01	11	190	70
10	00	380	20
10	01	380	25
10	10	380	50
10	11	380	100
11	00	760	30
11	01	760	35

Table 104. DR and BW configuration setting (continued)

DR [1:0]	BW [1:0]	ODR [Hz]	Cut-off [Hz](1)
11	10	760	50
11	11	760	100

1. Values in the table are indicative and they can vary proportionally with the specific ODR value

The combination of **PD, Zen, Yen, Xen** is used to set the angular rate sensor in different modes (Power-down / Normal / Sleep mode) according to the following table:

Table 105. Power mode selection configuration

Mode	PD	Zen	Yen	Xen
Power-down	0	-	-	-
Sleep	1	0	0	0
Normal	1	-	-	-

8.58 CTRL_REG2_G (21h)

Angular rate sensor control register 2 (r/w).

Table 106. CTRL_REG2_G register

EXTRen	LVLen	HPM1	HPM0	HPCF3	HPCF2	HPCF1	HPCF0

Table 107. CTRL_REG2_G description

EXTRen	Edge-sensitive trigger Enable: Default value: 0 (0: external trigger disabled; 1: External trigger enabled)
LVLen	Level-sensitive trigger Enable: Default value: 0 (0: level sensitive trigger disabled; 1: level sensitive trigger enabled)
HPM [1:0]	High-pass filter mode selection. Default value: 00 Refer to *Table 108*
HPCF [3:0]	High-pass filter cut-off frequency selection. Default value: 0000 Refer to *Table 109*

Table 108. High-pass filter mode configuration

HPM1	HPM0	High-pass filter mode
0	0	Normal mode (reset reading *REFERENCE_G (25h)* register)
0	1	Reference signal for filtering
1	0	Normal mode
1	1	Autoreset on interrupt event

Table 109. High-pass filter cut-off frequency configuration [Hz](1)

HPCF[3:0]	ODR=95 Hz	ODR=190 Hz	ODR=380 Hz	ODR=760 Hz
0000	7.2	13.5	27	51.4
0001	3.5	7.2	13.5	27
0010	1.8	3.5	7.2	13.5
0011	0.9	1.8	3.5	7.2
0100	0.45	0.9	1.8	3.5
0101	0.18	0.45	0.9	1.8
0110	0.09	0.18	0.45	0.9
0111	0.045	0.09	0.18	0.45
1000	0.018	0.045	0.09	0.18
1001	0.009	0.018	0.045	0.09

1. Values in the table are indicative and they can vary proportionally with the specific ODR value

8.59 CTRL_REG3_G (22h)

Angular rate sensor control register 3 (r/w).

Table 110. CTRL_REG3_G register

I1_Int1	I1_Boot	H_Lactive	PP_OD	I2_DRDY	I2_WTM	I2_ORun	I2_Empty

Table 111. CTRL_REG3_G description

I1_Int1	Interrupt enable on INT1_G pin. Default value 0. (0: Disable; 1: Enable)
I1_Boot	Boot status available on INT1_G. Default value 0. (0: Disable; 1: Enable)
H_Lactive	Interrupt active configuration on INT1_G. Default value 0. (0: High; 1: Low)
PP_OD	Push-pull / Open drain. Default value: 0. (0: Push-pull; 1: Open drain)
I2_DRDY	Date ready on DRDY_G/INT2_G. Default value 0. (0: Disable; 1: Enable)
I2_WTM	FIFO watermark interrupt on DRDY_G/INT2_G. Default value: 0. (0: Disable; 1: Enable)
I2_ORun	FIFO overrun interrupt on DRDY_G/INT2_G Default value: 0. (0: Disable; 1: Enable)
I2_Empty	FIFO empty interrupt on DRDY_G/INT2_G. Default value: 0. (0: Disable; 1: Enable)

8.60 CTRL_REG4_G (23h)

Angular rate sensor control register 4 (r/w).

Table 112. CTRL_REG4_G register

BDU	BLE	FS1	FS0	0	0	0	SIM

Table 113. CTRL_REG4_G description

BDU	Block data update. Default value: 0 (0: continuous update; 1: output registers not updated until MSb and LSb reading)
BLE	Big/little endian data selection. Default value 0. (0: Data LSb @ lower address; 1: Data MSb @ lower address)
FS [1:0]	Full scale selection. Default value: 00 (00: 250 dps; 01: 500 dps; 10: 2000 dps; 11: 2000 dps)
SIM	3-wire SPI Serial interface read mode enable. Default value: 0 (0: 3-wire Read mode disabled; 1: 3-wire read enabled).

8.61 CTRL_REG5_G (24h)

Angular rate sensor control register 5 (r/w).

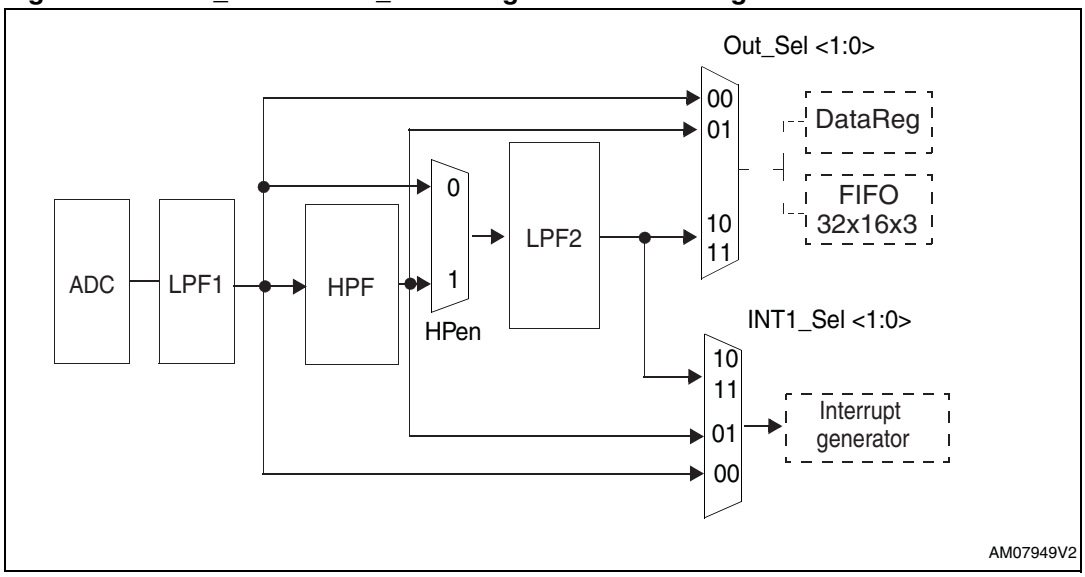
Table 114. CTRL_REG5_G register

BOOT	FIFO_EN	--	HPen	INT1_Sel1	INT1_Sel0	Out_Sel1	Out_Sel0

Table 115. CTRL_REG5_G description

BOOT	Reboot memory content. Default value: 0 (0: Normal mode; 1: reboot memory content)
FIFO_EN	FIFO enable. Default value: 0 (0: FIFO disable; 1: FIFO Enable)
HPen	High-pass filter Enable. Default value: 0 (0: HPF disabled; 1: HPF enabled, see *Figure 20*)
INT1_Sel [1:0]	INT1 selection configuration. Default value: 0 (see *Figure 20*)
Out_Sel [1:0]	Out selection configuration. Default value: 0 (see *Figure 20*)

Figure 20. INT1_Sel and Out_Sel configuration block diagram



8.62 REFERENCE_G (25h)

Interrupt reference value register (r/w).

Table 116. REFERENCE_G register

Ref7	Ref6	Ref5	Ref4	Ref3	Ref2	Ref1	Ref0

Table 117. REFERENCE_G register description

Ref [7:0]	Reference value for interrupt generation. Default value: 0

8.63 OUT_TEMP_G (26h)

Temperature data output register (r).

Table 118. OUT_TEMP_G register

Temp7	Temp6	Temp5	Temp4	Temp3	Temp2	Temp1	Temp0

Table 119. OUT_TEMP_G register description

Temp [7:0]	Temperature data (1LSb/deg - 8-bit resolution).The value is expressed as two's complement.

8.64 STATUS_REG_G (27h)

Angular rate sensor register (r).

Table 120. STATUS_REG_G register

ZYXOR	ZOR	YOR	XOR	ZYXDA	ZDA	YDA	XDA

Table 121. STATUS_REG_G register description

ZYXOR	X, Y, Z-axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data has overwritten the previous data before it was read)
ZOR	Z axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the Z-axis has overwritten the previous data)
YOR	Y axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the Y-axis has overwritten the previous data)
XOR	X axis data overrun. Default value: 0 (0: no overrun has occurred; 1: new data for the X-axis has overwritten the previous data)
ZYXDA	X, Y, Z -axis new data available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)
ZDA	Z axis new data available. Default value: 0 (0: new data for the Z-axis is not yet available; 1: new data for the Z-axis is available)
YDA	Y axis new data available. Default value: 0 (0: new data for the Y-axis is not yet available;1: new data for the Y-axis is available)
XDA	X axis new data available. Default value: 0 (0: new data for the X-axis is not yet available; 1: new data for the X-axis is available)

8.65 OUT_X_L_G (28h), OUT_X_H_G (29h)

X-axis angular rate output data register (r). The value is expressed as two's complement.

8.66 OUT_Y_L_G (2Ah), OUT_Y_H_G (2Bh)

Y-axis angular rate output data register (r). The value is expressed as two's complement.

8.67 OUT_Z_L_G (2Ch), OUT_Z_H_G (2Dh)

Z-axis angular rate output data register (r). The value is expressed as two's complement.

8.68 FIFO_CTRL_REG_G (2Eh)

Angular rate sensor FIFO control register (r/w).

Table 122. FIFO_CTRL_REG_G register

FM2	FM1	FM0	WTM4	WTM3	WTM2	WTM1	WTM0

Table 123. FIFO_CTRL_REG_G register description

FM [2:0]	FIFO mode selection. Default value: 000 (see *Table 124*)
WTM [4:0]	FIFO threshold. Watermark level setting

Table 124. FIFO mode configuration

FM2	FM1	FM0	FIFO mode
0	0	0	Bypass mode
0	0	1	FIFO mode
0	1	0	Stream mode
0	1	1	Stream-to-FIFO mode
1	0	0	Bypass-to-stream mode

8.69 FIFO_SRC_REG_G (2Fh)

Angular rate sensor FIFO source control register (r).

Table 125. FIFO_SRC_REG_G register

WTM	OVRN	EMPTY	FSS4	FSS3	FSS2	FSS1	FSS0

Table 126. FIFO_SRC_REG_G register description

WTM	Watermark status. (0: FIFO filling is lower than WTM level; 1: FIFO filling is equal or higher than WTM level)
OVRN	Overrun bit status. (0: FIFO is not completely filled; 1:FIFO is completely filled)
EMPTY	FIFO empty bit. (0: FIFO not empty; 1: FIFO empty)
FSS [4:0]	FIFO stored data level

8.70 INT1_CFG_G (30h)

Angular rate sensor FIFO source control register (r/w).

Table 127. INT1_CFG_G register

AND/OR	LIR	ZHIE	ZLIE	YHIE	YLIE	XHIE	XLIE

Table 128. INT1_CFG_G description

AND/OR	AND/OR combination of interrupt events. Default value: 0 (0: OR combination of interrupt events 1: AND combination of interrupt events
LIR	Latch Interrupt request. Default value: 0 (0: interrupt request not latched; 1: interrupt request latched) Cleared by reading INT1_SRC_G reg.
ZHIE	Enable interrupt generation on Z high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured value higher than preset threshold)
ZLIE	Enable interrupt generation on Z low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured value lower than preset threshold)
YHIE	Enable interrupt generation on Y high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured value higher than preset threshold)
YLIE	Enable interrupt generation on Y low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured value lower than preset threshold)
XHIE	Enable interrupt generation on X high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured value higher than preset threshold)
XLIE	Enable interrupt generation on X low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured value lower than preset threshold)

8.71 INT1_SRC_G (31h)

Angular rate sensor interrupt source register (r).

Table 129. INT1_SRC_G register

0	IA	ZH	ZL	YH	YL	XH	XL

Table 130. INT1_SRC_G register description

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
ZH	Z high. Default value: 0 (0: no interrupt, 1: Z High event has occurred)
ZL	Z low. Default value: 0 (0: no interrupt; 1: Z Low event has occurred)
YH	Y high. Default value: 0 (0: no interrupt, 1: Y High event has occurred)
YL	Y low. Default value: 0 (0: no interrupt, 1: Y Low event has occurred)
XH	X high. Default value: 0 (0: no interrupt, 1: X High event has occurred)
XL	X low. Default value: 0 (0: no interrupt, 1: X Low event has occurred)

Reading at this address clears the *INT1_SRC_G (31h)* IA bit (and eventually the interrupt signal on the INT1_G pin) and allows the refreshing of data in the *INT1_SRC_G register* if the latched option was chosen.

8.72 INT1_THS_XH_G (32h)

Angular rate sensor interrupt threshold x-axis high register (r/w).

Table 131. INT1_THS_XH_G register

-	THSX14	THSX13	THSX12	THSX11	THSX10	THSX9	THSX8

Table 132. INT1_THS_XH_G description

THSX [14:8]	Interrupt threshold. Default value: 000 0000

8.73 INT1_THS_XL_G (33h)

Angular rate sensor interrupt threshold x-axis low register (r/w).

Table 133. INT1_THS_XL_G register

THSX7	THSX6	THSX5	THSX4	THSX3	THSX2	THSX1	THSX0

Table 134. INT1_THS_XL_G description

THSX [7:0]	Interrupt threshold. Default value: 0000 0000

8.74 INT1_THS_YH _G (34h)

Angular rate sensor interrupt threshold y-axis high register (r/w).

Table 135. INT1_THS_YH_G register

-	THSY14	THSY13	THSY12	THSY11	THSY10	THSY9	THSY8

Table 136. INT1_THS_YH_G description

THSY [14:8]	Interrupt threshold. Default value: 000 0000

8.75 INT1_THS_YL_G (35h)

Angular rate sensor interrupt threshold y-axis low register (r/w).

Table 137. INT1_THS_YL_G register

THSY7	THSY6	THSY5	THSY4	THSY3	THSY2	THSY1	THSY0

Table 138. INT1_THS_YL_G description

THSY [7:0]	Interrupt threshold. Default value: 0000 0000

8.76 INT1_THS_ZH_G (36h)

Angular rate sensor interrupt threshold z-axis high register (r/w).

Table 139. INT1_THS_ZH_G register

-	THSZ14	THSZ13	THSZ12	THSZ11	THSZ10	THSZ9	THSZ8

Table 140. INT1_THS_ZH_G description

THSZ [14:8]	Interrupt threshold. Default value: 000 0000

8.77 INT1_THS_ZL_G (37h)

Angular rate sensor interrupt threshold z-axis low register (r/w).

Table 141. INT1_THS_ZL_G register

THSZ7	THSZ6	THSZ5	THSZ4	THSZ3	THSZ2	THSZ1	THSZ0

Table 142. INT1_THS_ZL_G description

THSZ [7:0]	Interrupt threshold. Default value: 0000 0000

8.78 INT1_DURATION_G (38h)

Angular rate sensor interrupt duration register (r/w).

Table 143. INT1_DURATION_G register

WAIT	D6	D5	D4	D3	D2	D1	D0

Table 144. INT1_DURATION_G description

WAIT	WAIT enable. Default value: 0 (0: disable; 1: enable)
D [6:0]	Duration value. Default value: 000 0000

D6 - D0 bits set the minimum duration of the interrupt event to be recognized. Duration steps and maximum values depend on the ODR chosen.

WAIT bit has the following meaning:

Wait ='0': the interrupt falls immediately if signal crosses the selected threshold

Wait ='1': if the signal crosses the selected threshold, the interrupt falls only after the duration has counted the number of samples at the selected data rate, written into the duration counter register.

Figure 21. Wait disabled

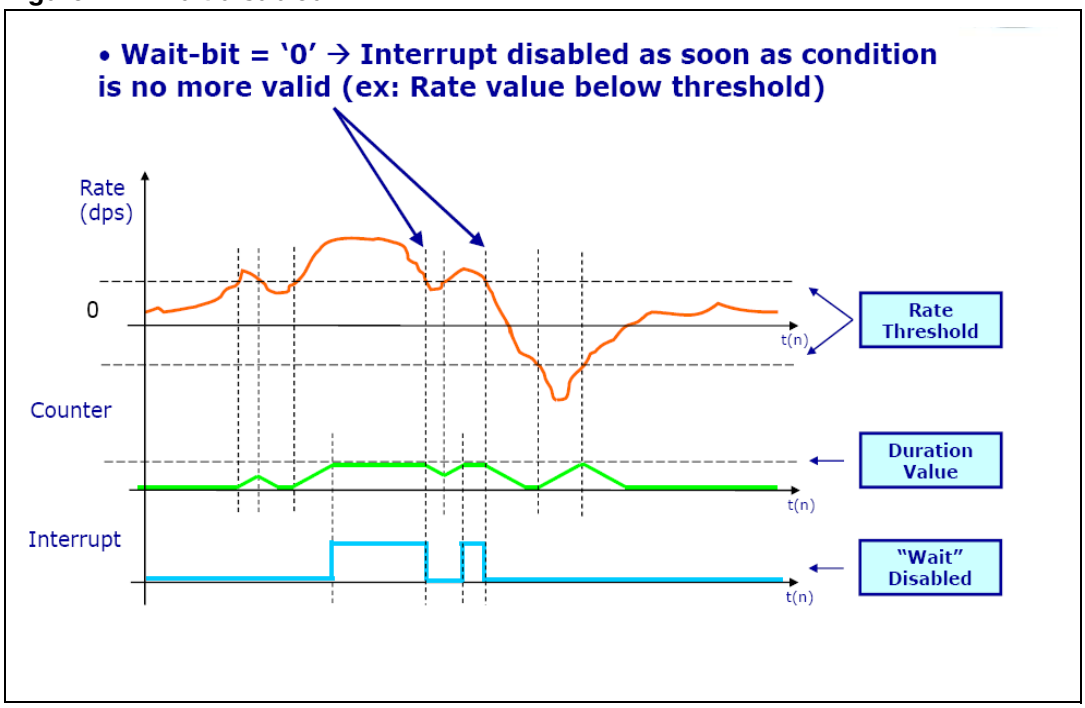


Figure 22. Wait enabled

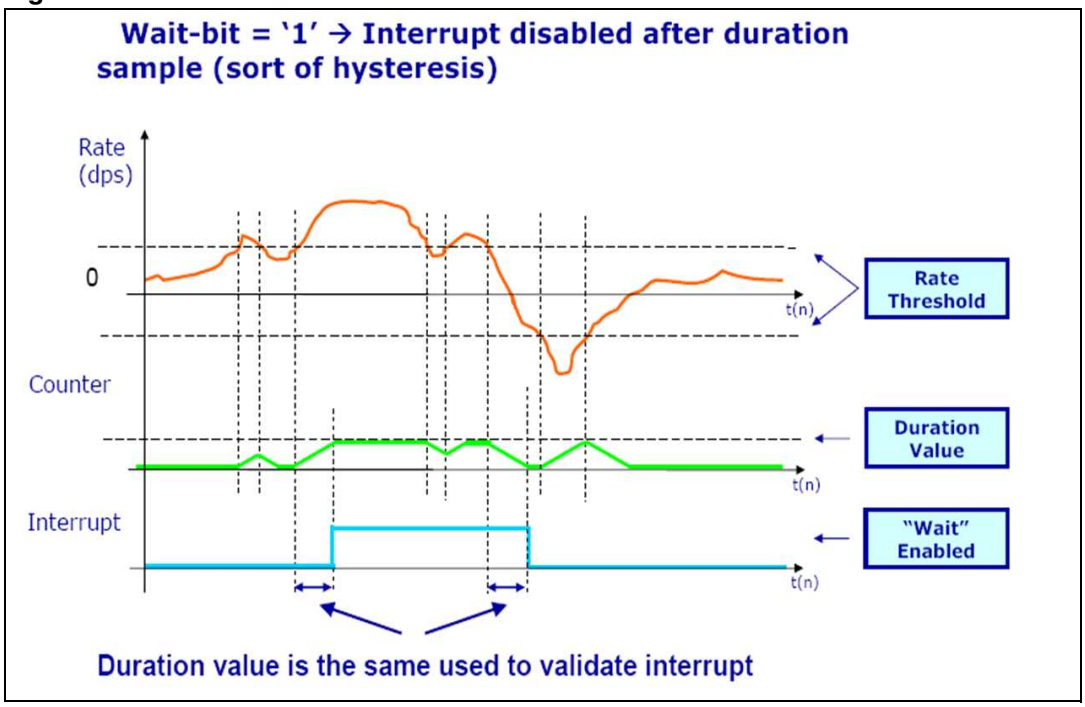

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: *www.st.com*.
ECOPACK is an ST trademark.
