

4 x 48 W MOSFET quad bridge power amplifier

Datasheet – production data

Features

- Multipower BCD technology
- High output power capability:
 - 4 x 48 W/4 Ω max.
 - 4 x 28 W/4 Ω @ 14.4 V, 1 kHz, 10 %
 - 4 x 72 W/2 Ω max.
- MOSFET output power stage
- Excellent 2 Ω driving capability
- Hi-Fi class distortion
- Low output noise
- Standby function
- Mute function
- Automute at min. supply voltage detection
- Low external component count:
 - Internally fixed gain (26 dB)
 - No external compensation
 - No bootstrap capacitors
- Output DC offset detector
- Protections:
 - Output short circuit to GND, to V_S , across the load
 - Very inductive loads
 - Overrating chip temperature with soft thermal limiter
 - Load dump voltage

- Fortuitous open GND
- Reversed battery
- ESD

Description

The TDA7851F is a breakthrough MOSFET technology class AB audio power amplifier, designed for high-power car radio.

The fully complementary P-Channel/N-Channel output structure allows a rail-to-rail output voltage swing. This, combined with high output current and minimized saturation losses, sets new power references in the car-radio field, with unparalleled distortion performance.

4 Application hints

4.1 SVR

Besides its contribution to the ripple rejection, the SVR capacitor governs the turn ON/OFF time sequence and, consequently, plays an essential role in the pop optimization during ON/OFF transients. To conveniently serve both needs, **its minimum recommended value is 10 μ F**.

4.2 Input stage

The TDA7851's inputs are ground-compatible and can stand very high input signals (± 8 Vpk) without any performance degradation. If the standard value for the input capacitors (0.1 μ F) is adopted, the low frequency cut-off amounts to 16 Hz.

The input capacitors should be 1/4 of the capacitor connected to AC-GND pin for optimum pop performance.

4.3 Standby and muting

Standby and muting facilities are both CMOS-compatible. In absence of true CMOS ports or microprocessors, a direct connection to V_s of these two pins is admissible but a 470 k Ω equivalent resistance should be present between the power supply and muting and standby pins.

R-C cells have always to be used in order to smooth down the transitions for preventing any audible transient noise.

About standby, the time constant to be assigned in order to obtain a virtually pop-free transition has to be slower than 2.5 V/ms.

4.4 Heatsink definition

Under normal usage (4 Ohm speakers) the heatsink's thermal requirements have to be deduced from [Figure 16](#), which reports the simulated power dissipation when real music/speech programmes are played out. Noise with gaussian-distributed amplitude was employed for this simulation. Based on that, frequent clipping occurrence (worst-case) causes $P_{diss} = 26$ W. Assuming $T_{amb} = 70$ °C and $T_{CHIP} = 150$ °C as boundary conditions, the heatsink's thermal resistance should be approximately 2 °C/W. This would avoid any thermal shutdown occurrence even after long-term and full-volume operation.
