

## CPKW002A0C1 Power Module; dc-dc Converter

### 36-75 Vdc Input; 15.0Vdc 2.0A Output

### RoHS Compliant

#### Applications

- Distributed power architectures
- Wireless Networks
- Access and Optical Network Equipment

#### Options

- Remote On/Off logic (positive or negative)

#### Features

- Compliant to RoHS EU Directive 2002/95/EC (-Z versions)
- Delivers up to 30W of output power: 15V (2A)
- Small size: 33.0 mm x 24.0 mm x 8.5max mm (1.30 x 0.945 x 0.335 in)
- Through-hole (TH) mounting
- Sixteenth-Brick compatible footprint
- Cost efficient open frame design
- Single tightly regulated output
- Remote On/Off
- Output overcurrent protection
- Output overvoltage protection
- Over temperature protection
- Output voltage adjustment trim -20% to +10%
- Wide operating temperature range (-40°C to +85°C)
- UL\* 60950-1 Recognized, CSA† C22.2 No. 60950-1-03 Certified, and VDE‡ 0805 (IEC60950, 3<sup>rd</sup> Edition) Licensed
- CE mark meets 2006/95/EC directives§
- ISO\*\* 9001 and ISO 14001 certified manufacturing facilities

#### Description

The CPKW002A0C1 power module is an isolated dc-dc converter that operates over a wide input voltage range of 36 to 75 Vdc and provides a single precisely regulated output. This module is a low cost, smaller size alternative to the existing QW030C1. The output is fully isolated from the input, allowing versatile polarity configurations and grounding connections. The module exhibit high efficiency, typical 90% for 15V at 2A. Built-in filtering for both input and output minimizes the need for external filtering. These open frame modules are available in through-hole (TH) form. Standard features include Remote On/Off, output voltage adjust, overvoltage, overcurrent and overtemperature protection.

## Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only, functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect the device reliability.

Parameter	Device	Symbol	Min	Max	Unit
Input Voltage	All	$V_{IN}$	-0.3	80	Vdc
Continuous					
Transient (100ms)	All	$V_{IN, trans}$	-0.3	100	Vdc
Operating Ambient Temperature (see Thermal Considerations section)	All	$T_A$	-40	90	°C
Storage Temperature	All	$T_{stg}$	-55	125	°C
I/O Isolation Voltage	All	—	—	500	Vdc

## Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

Parameter	Device	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	All	$V_{IN}$	36	54	75	Vdc
Maximum Input Current ( $V_{IN}=0V$ to 75V, $I_O=I_{O, max}$ )	All	$I_{IN, max}$			1.5	Adc
Inrush Transient	All	$I^2t$			0.06	A <sup>2</sup> s
Input Reflected Ripple Current, peak-to-peak (5Hz to 20MHz, 12 $\mu$ H source impedance; $V_{IN}=0V$ to 75V, $I_O=I_{O, max}$ ; see Figure 9)	All			30		mAp-p
Input Ripple Rejection (120Hz)	All			50		dB
EMC, EN55022			See EMC Considerations section			

### CAUTION: This power module is not internally fused. An input line fuse must always be used.

This power module can be used in a wide variety of applications, ranging from simple standalone operation to an integrated part of sophisticated power architectures. To preserve maximum flexibility, internal fusing is not included, however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a fast-acting fuse with a maximum rating of 3A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data sheet for further information.

### Characteristic Curves

The following figures provide typical characteristics for the CPKW002A0C1 (15.0V, 2.0A) at 25°C.

Figure 1. Converter Efficiency versus Output Current

Figure 2. Derating Output Current versus Local Ambient Temperature and Airflow

Figure 3. Typical Output Ripple and Noise, @ 80% Full Load.

Figure 4. Typical Start-Up with application of Vin.

Figure 5. Transient Response to Dynamic Load Change from 50% to 75% to 50% of full load.

Figure 6. Typical Output Rise Characteristic, without external capacitance fitted.

## Test Configurations

NOTE: Measure input reflected ripple current with a simulated source inductance ( $L_{TEST}$ ) of 12µH. Capacitor  $C_S$  offsets possible battery impedance. Measure current as shown above.

Figure 7. Input Reflected Ripple Current Test Setup

NOTE: Use a 1µF ceramic capacitor and a 10µF aluminium or tantalum capacitor. The scope measurement should be made using a BNC socket. Position the load 50mm to 75mm (2" to 3") from the module.

Figure 8. Output Ripple and Noise Test Setup

NOTE: All voltage measurements to be taken at the module terminals, as shown above. If sockets are used then Kelvin connections are required at the module terminals to avoid measurement errors due to socket contact resistance.

Figure 9. Output Voltage and Efficiency Test Setup

$$Efficiency (\eta) = \left[ \frac{V_O \times I_O}{V_{IN} \times I_{IN}} \right] \times 100 (\%)$$

## Design Considerations

### Input Source Impedance

The power module should be connected to a low ac-impedance source. Highly inductive source impedance can affect the stability of the power module. For the test configuration in Figure 7 a 33µF electrolytic capacitor (ESR < 0.7Ω at 100kHz), mounted close to the power module helps ensure the stability of the unit. Consult the factory for further application guidelines.

### Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., UL 60950-1, CSA C22.2 No. 60950-1-03, and VDE 0805 (IEC60950, 3<sup>rd</sup> Edition).

The modules spacing (creepages and clearances) have been designed to meet Functional Insulation.

If the input source is non-SELV (ELV or a hazardous voltage greater than 60 Vdc and less than or equal to 75Vdc), for the module's output to be considered as meeting the requirements for safety extra-low voltage (SELV), all of the following must be true:

- The input source is to be provided with reinforced insulation from any other hazardous voltages, including the ac mains.
- If the output pins are accessible to the end user, then to maintain the output voltage to ground (earth) within ELV or SELV limits,  $V_{in}(+)$  pin of the input and  $V_{out}(-)$  pin of the output must be reliably grounded (earthed) in the end application.
- The input pins of the module are not operator accessible.
- Another SELV reliability test is conducted on the whole system (combination of supply source and subject module), as required by the safety agencies, to verify that under a single fault, hazardous voltages do not appear at the module's output.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a maximum 3A fast-acting fuse in the ungrounded lead.

## Feature Descriptions

### Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting continuously. At the point of current-limit inception, the unit enters hiccup mode. The unit operates normally once the output current is brought back into its specified range. The average output current during hiccup is 10%  $I_{O, max}$ .

### Remote On/Off

Two remote on/off options are available. Positive logic turns the module on during a logic high voltage on the ON/OFF pin, and off during a logic low. Negative logic remote On/Off, device code suffix "1", turns the module off during a logic high and on during a logic low.

To maintain compatibility with LW series power modules the Remote On/Off pin is optional for the TH (through hole) version. Standard TH modules have no On/Off pin fitted. TH modules ordered with device code suffix "1" are negative logic with the On/Off pin fitted.

**Figure 10. Remote On/Off Implementation**

To turn the power module on and off, the user must supply a switch (open collector or equivalent) to control the voltage ( $V_{on/off}$ ) between the ON/OFF terminal and the  $V_{IN(-)}$  terminal. Logic low is  $0V \leq V_{on/off} \leq 1.2V$ . The maximum  $I_{on/off}$  during a logic low is 1mA, the switch should be maintain a logic low level whilst sinking this current.

During a logic high, the typical  $V_{on/off}$  generated by the module is 5.0V, and the maximum allowable leakage current at  $V_{on/off} = 5.0V$  is 50 $\mu$ A.

If not using the remote on/off feature:

For positive logic, leave the ON/OFF pin open.

For negative logic, short the ON/OFF pin to  $V_{IN(-)}$ .

### Input Undervoltage Lockout

At input voltages below the input undervoltage lockout limit, the module operation is disabled. The module will only begin to operate once the input voltage is raised above the undervoltage lockout turn-on threshold,  $V_{UV/ON}$ .

Once operating, the module will continue to operate until the input voltage is taken below the undervoltage turn-off threshold,  $V_{UV/OFF}$ .

### Output Overvoltage Protection

The output overvoltage protection consists of circuitry that internally clamps the output voltage. If a more accurate output overvoltage protection scheme is required then this should be implemented externally via use of the remote on/off pin.

### Overtemperature Protection

These modules feature an overtemperature protection circuit to safeguard against thermal damage. The circuit shuts down the module if the temperature measured at the thermal reference point  $T_{ref}$  exceeds maximum limits. The module will automatically restart if the temperature at  $T_{ref}$  has reduced sufficiently. The module can continue in this mode until the overtemperature condition is cleared.

## Feature Descriptions (continued)

### Output Voltage Set-Point Adjustment (Optional pin on TH version)

Trimming allows the user to increase or decrease the output voltage set point of the module. This is accomplished by connecting an external resistor between the TRIM pin and either the Vout+ pin or the Vout- pin.

#### Trim Down – Decrease Output Voltage

By connecting an external resistor between the TRIM pin and Vout+ pin (R<sub>adj-down</sub>), the output voltage set point decreases (see figure 11). The following equation determines the external resistor value to obtain an output voltage change from V<sub>o, nom</sub> to the desired V<sub>o, adj</sub>:

$$R_{adj-down} = \left[ \frac{(V_{o,adj} - L) \times G}{(V_{o,nom} - V_{o,adj})} - H \right] \Omega$$

Note: Values for G, H, L and K are defined for each module version in the following table 1 .

Figure 11. Circuit Configuration to Decrease Output Voltage

#### Trim Up – Increase Output Voltage

By connecting an external resistor between the TRIM pin and Vout- pin (R<sub>adj-up</sub>), the output voltage set point increases (see figure 12). The following equation determines the external resistor value to obtain an output voltage change from V<sub>o, nom</sub> to the desired V<sub>o, adj</sub>:

$$R_{adj-up} = \left[ \frac{(G \times L)}{(V_{o,adj} - L - K)} - H \right] \Omega$$

Note: Values for G, H, L and K are defined for each module version in the following table 1 .

Figure 12. Circuit Configuration to Increase Output Voltage

Module	G	H	K	L
CPKW002A0C1	10,000	5110	12.5	2.5

Table 1 . Trim Constants CPKW002A0C1

The combination of the output voltage adjustment and the output voltage initial tolerance must not exceed the allowable trim range of 90% to 110% of the nominal output voltage as measured between the Vout+ and Vout- pins.

The CPKW002A0C1 power modules have a fixed current-limit set point. Therefore, as the output voltage is adjusted down, the available output power is reduced.

#### Trim Examples

For CPKW002A0C1, nominal 15.0V module. To trim module up to 15.5V (see figure 12):

$$R_{adj-up} = \left[ \frac{(10,000 \times 2.5)}{(15.5 - 2.5 - 12.5)} - 5110 \right] \Omega$$

$$R_{adj-up} = 44,890 \Omega$$

**Feature Descriptions** (continued)

**Thermal Considerations**

The power module operates in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation.

Considerations include ambient temperature, airflow, module power dissipation, and the need for increased reliability. A reduction in the operating temperature of the module will result in an increase in reliability. The thermal data presented here is based on physical measurements taken in a wind tunnel.

The thermal reference point,  $T_{ref}$  used in the specifications is shown in Figure 13. For reliable operation this temperature should not exceed 110°C.

Please refer to the Application Note “Thermal Characterization Process For Open-Frame Board-Mounted Power Modules” for a detailed discussion of thermal aspects including maximum device temperatures.

**Figure 13.  $T_{ref}$  Temperature Measurement Location**

**Heat Transfer via Convection**

Increased airflow over the module enhances the heat transfer via convection. Derating figures showing the maximum output current that can be delivered by each module versus local ambient temperature ( $T_A$ ) for natural convection and up to 2m/s (400 ft./min) are shown in the respective Characteristics Curves section.

**EMC Considerations**

The figure 14 shows a suggested configuration to meet the conducted emission limits of EN55022 Class B in an application that only requires 500Vdc operational isolation between input and output.

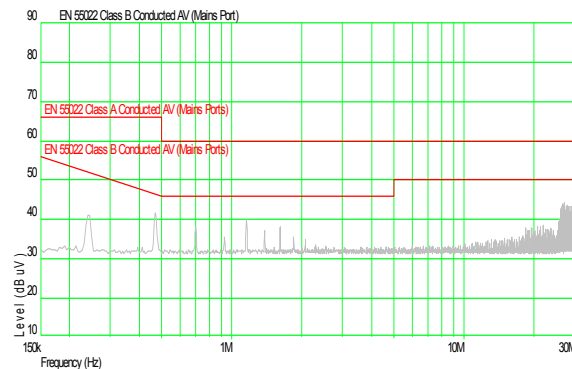

Component Values:

C1, C2 = 1500nF low impedance SMT ceramic

- C3 = 220uF low impedance electrolytic
- C4 = 1000nF low impedance SMT ceramic
- C5 = 220nF low impedance SMT ceramic
- L1 = Common Mode inductor, Pulse Engineering type P0420 1.32mH.
- L2 = 10uH differential inductor

**Figure 14. Suggested Configuration for EN55022 Class B**

**Figure 15. EMC signature using above filter.**

**Layout Considerations**

The CPKW002A0C1 power module is a low profile in order to be used in fine pitch system card architectures. As such, component clearance between the bottom of the power module and the mounting board is limited. Avoid placing copper areas on the outer layer directly underneath the power module. Also avoid placing via interconnects underneath the power module.

For additional layout guide-lines, refer to FLTR100V10 data sheet.

### Post Solder Cleaning and Drying Considerations

Post solder cleaning is usually the final circuit-board assembly process prior to electrical board testing. The result of inadequate cleaning and drying can affect both

the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning and drying procedures, refer to Lineage Power *Board Mounted Power Modules: Soldering and Cleaning* Application Note (AP01-056EPS).
