

SM802117

ClockWorks™ GbE (125MHz) Ultra-Low Jitter, LVPECL Frequency Synthesizer

General Description

The SM802117 is a member of the ClockWorks™ family of devices from Micrel and provides an extremely low-noise timing solution for GbE Ethernet clock signals. It is based upon a unique patented RotaryWave® architecture that provides very low phase noise.

The device operates from a 3.3V or 2.5V power supply and synthesizes LVPECL output clocks at 125MHz. There are two differential clock outputs each with it's own OE pin allowing them to be disabled independently. The SM802117 accepts a 25 MHz crystal or LVCMOS reference clock.

Data sheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Features

- Generates one or two LVPECL clock outputs at 125MHz
- 2.5V or 3.3V operating range
- Typical phase jitter @ 125MHz (1.875MHz to 20MHz): 115fs
- Industrial temperature range (-40°C to +85°C)
- Green, RoHS, and PFOS compliant
- Available in 24-pin 4mm × 4mm QFN package

Applications

- Gigabit Ethernet - PHY

12	OE2	I, (SE)	LVC MOS	Output Enable, Q2 disables to tri-state, 0 = Disabled, 1 = Enabled, 45K Ω pull-up

Application Information

Input Reference

When operating with a crystal input reference, do not apply a switching signal to REF_IN.

Crystal Layout

Keep the layers under the crystal as open as possible and do not place switching signals or noisy supplies under the crystal.

Crystal load capacitance is built inside the die so no external capacitance is needed. See the *Selecting a Quartz crystal for the Clockworks Flex I Family of Precision Synthesizers* application note for further details.

Contact Micrel's HBW applications group if you need assistance on selecting a suitable crystal for your application at hbwhelp@micrel.com.

Note:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB.
4. The circuit is designed to meet the AC and DC specifications shown in the above table(s) after thermal equilibrium has been established.

Notes:

5. All phase noise measurements were taken with an Agilent 5052B phase noise system.
6. Defined as skew between outputs at the same supply voltage and with equal load conditions and same frequency; Measured at the output differential crossing points.
7. Measured using 25MHz crystal as the input reference source. If using an external reference input, use a low phase noise source. With an external reference, the phase noise will follow the input source phase noise up to about 1MHz.
