DESCRIPTION

The SY10/100E457 are 3-bit differential 2:1 multiplexers. The fully differential data path makes the devices ideal for multiplexing low skew clock or other skew sensitive signals. Multiple VBB pins are provided to ease AC coupling input signals.

The higher frequency outputs provide the device with a >1.0GHz bandwidth to meet the needs of the most demanding system clock.

Both separate selects and a common select are provided to make the device well suited for both data path and random logic applications.

DC ELECTRICAL CHARACTERISTICS

V _{CMR}	Common Mode Range	-1.5	—	0	-1.5	—	0	-1.5	—	0	V	2

Notes:

1. Differential input voltage required to obtain a full ECL swing on the outputs.
2. V_{CMR} is referenced to the most positive side of the differential input signal. Normal operation is obtained when the input signals are within the V_{CMR} range and the input swing is greater than V_{PP} (min.) and <1V.

Notes:

1. Within-device skew is defined as identical transitions on similar paths through a device.
2. Duty cycle skew guarantee holds only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.
3. Minimum input swing for which AC parameters are guaranteed.
