# 士15kV ESD-Protected, +5V RS-232 Transceivers 

General Description

The MAX202E-MAX213E, MAX232E/MAX241E line drivers/receivers are designed for RS-232 and V. 28 communications in harsh environments. Each transmitter output and receiver input is protected against $\pm 15 \mathrm{kV}$ electrostatic discharge (ESD) shocks, without latchup. The various combinations of features are outlined in the Selector Guide. The drivers and receivers for all ten devices meet all EIA/TIA-232E and CCITT V. 28 specifications at data rates up to 120kbps, when loaded in accordance with the EIA/TIA-232E specification.
The MAX211E/MAX213E/MAX241E are available in 28pin SO packages, as well as a 28-pin SSOP that uses 60\% less board space. The MAX202E/MAX232E come in 16-pin TSSOP, narrow SO, wide SO, and DIP packages. The MAX203E comes in a 20-pin DIP/SO package, and needs no external charge-pump capacitors. The MAX205E comes in a 24-pin wide DIP package, and also eliminates external charge-pump capacitors. The MAX206E/MAX207E/MAX208E come in 24-pin SO, SSOP, and narrow DIP packages. The MAX232E/MAX241E operate with four $1 \mu \mathrm{~F}$ capacitors, while the MAX202E/MAX206E/MAX207E/MAX208E/ MAX211E/MAX213E operate with four $0.1 \mu \mathrm{~F}$ capacitors, further reducing cost and board space.

## Applications

Notebook, Subnotebook, and Palmtop Computers Battery-Powered Equipment Hand-Held Equipment

## Next-Generation Device Features

- For Low-Voltage Applications MAX3222E/MAX3232E/MAX3237E/MAX3241E/ MAX3246E: $\pm 15 k V$ ESD-Protected Down to $10 \mathrm{nA},+3.0 \mathrm{~V}$ to +5.5 V , Up to 1 Mbps , True RS-232 Transceivers (MAX3246E Available in a UCSPт Package)
- For Low-Power Applications

MAX3221/MAX3223/MAX3243: 1 $\mu$ A Supply Current, True +3V to +5.5V RS-232 Transceivers with Auto-Shutdown ${ }^{\text {TM }}$

- For Space-Constrained Applications MAX3233E/MAX3235E: $\pm 15 \mathrm{kV}$ ESD-Protected, $1 \mu \mathrm{~A}, 250 \mathrm{kbps},+3.0 \mathrm{~V} /+5.5 \mathrm{~V}$, Dual RS-232 Transceivers with Internal Capacitors - For Low-Voltage or Data Cable Applications MAX3380E/MAX3381E: +2.35V to $+5.5 \mathrm{~V}, 1 \mu \mathrm{~A}$, 2Tx/2Rx RS-232 Transceivers with $\pm 15 \mathrm{kV}$ ESDProtected I/O and Logic Pins

## Ordering Information

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

TRANSMITTER INPUT PULL-UP RESISTORS, ENABLE, AND SHUTDOWN ARE NOT PROVIDED ON THE MAX202E, MAX203E, AND MAX232E. ENABLE AND SHUTDOWN ARE NOT PROVIDED ON THE MAX207E AND MAX208E.

Figure 3. Transition Slew-Rate Circuit

## Detailed Description

The MAX202E-MAX213E, MAX232E/MAX241E consist of three sections: charge-pump voltage converters, drivers (transmitters), and receivers. These E versions provide extra protection against ESD. They survive $\pm 15 \mathrm{kV}$ discharges to the RS-232 inputs and outputs, tested using the Human Body Model. When tested according to IEC1000-4-2, they survive $\pm 8 \mathrm{kV}$ contactdischarges and $\pm 15 \mathrm{kV}$ air-gap discharges. The rugged E versions are intended for use in harsh environments or applications where the RS-232 connection is frequently changed (such as notebook computers). The standard (non-"E") MAX202, MAX203, MAX205MAX208, MAX211, MAX213, MAX232, and MAX241 are recommended for applications where cost is critical.

## +5 V to $\pm 10 \mathrm{~V}$ Dual Charge-Pump Voltage Converter

The +5 V to $\pm 10 \mathrm{~V}$ conversion is performed by dual charge-pump voltage converters (Figure 4). The first charge-pump converter uses capacitor C1 to double the +5 V in' $-p^{\prime}$ ' 0 V , storing the +10 V on the output filter capacitor, $\equiv$ 「he second uses C2 to invert the +10 V
into -10V, storing the -10 V on the V - output filter capacitor, C4.
In shutdown mode, $\mathrm{V}_{+}$is internally connected to $\mathrm{V}_{\mathrm{CC}}$ by a $1 \mathrm{k} \Omega$ pull-down resistor, and V - is internally connected to ground by a $1 \mathrm{k} \Omega$ pull up resistor.

RS-232 Drivers
With VCC $=5 \mathrm{~V}$, the typical driver output voltage swing is $\pm 8 \mathrm{~V}$ when loaded with a nominal $5 \mathrm{k} \Omega$ RS-232 receiver. The output swing is guaranteed to meet EIA/TIA-232E and V. 28 specifications that call for $\pm 5 \mathrm{~V}$ minimum output levels under worst-case conditions. These include a $3 k \Omega$ load, minimum VCC, and maximum operating temperature. The open-circuit output voltage swings from ( $\mathrm{V}+-0.6 \mathrm{~V}$ ) to V -.
Input thresholds are CMOS/TTL compatible. The unused drivers' inputs on the MAX205E-MAX208E, MAX211E, MAX213E, and MAX241E can be left unconnected because $400 \mathrm{k} \Omega$ pull up resistors to VCC are included on-chip. Since all drivers invert, the pull up resistors force the unused drivers' outputs low. The MAX202E, MAX203E, and MAX232E do not have pull up resistors on the transmitter inputs.

## MAX202E-MAX213E, MAX232E/MAX241E土15kV ESD-Protected, +5V RS-232 Transceivers

Figure 4. Charge-Pump Diagram

When in low-power shutdown mode, the MAX205E/ MAX206E/MAX211E/MAX213E/MAX241E driver outputs are turned off and draw only leakage currents-even if they are back-driven with voltages between OV and 12 V . Below -0.5 V in shutdown, the transmitter output is diode-clamped to ground with a $1 \mathrm{k} \Omega$ series impedance.

## RS-232 Receivers

The receivers convert the RS-232 signals to CMOS-logic output levels. The guaranteed 0.8 V and 2.4 V receiver input thresholds are significantly tighter than the $\pm 3 \mathrm{~V}$ thresholds required by the EIA/TIA-232E specification. This allows the receiver inputs to respond to TTL/CMOSlogic levels, as well as RS-232 levels.
The guaranteed 0.8 V input low threshold ensures that receivers shorted to ground have a logic 1 output. The $5 \mathrm{k} \Omega$ input resistance to ground ensures that a receiver with its input left open will also have a logic 1 output.
Receiver inputs have approximately 0.5 V hysteresis. This provides clean output transitions, even with slow rise/fall-time signals with moderate amounts of noise and ringing.
In shutdown, the MAX213E's R4 and R5 receivers have no hysteresis.

## Shutdown and Enable Control (MAX205E/MAX206E/MAX211E/ MAX213E/MAX241E)

In shutdown mode, the charge pumps are turned off, V+ is pulled down to $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}$ - is pulled to ground, and the transmitter outputs are disabled. This reduces supply current typically to $1 \mu \mathrm{~A}$ ( $15 \mu \mathrm{~A}$ for the MAX213E). The time required to exit shutdown is under 1 ms , as shown in Figure 5.

## Receivers

All MAX213E receivers, except R4 and R5, are put into a high-impedance state in shutdown mode (see Tables 1a and 1b). The MAX213E's R4 and R5 receivers still function in shutdown mode. These two awake-inshutdown receivers can monitor external activity while maintaining minimal power consumption.
The enable control is used to put the receiver outputs into a high-impedance state, to allow wire-OR connection of two EIA/TIA-232E ports (or ports of different types) at the UART. It has no effect on the RS-232 drivers or the charge pumps.
Note: The enable control pin is active low for the MAX211E/MAX241E (EN), but is active high for the MAX213E (EN). The shutdown control pin is active high for the MAX205E/MAX206E/MAX211E/MAX241E (SHDN), but is active low for the MAX213E (SHDN).

## MAX202E-MAX213E, MAX232E/MAX241E土15kV ESD-Protected, +5V RS-232 Transceivers

The MAX213E's receiver propagation delay is typically $0.5 \mu \mathrm{~s}$ in normal operation. In shutdown mode, propagation delay increases to $4 \mu$ s for both rising and falling transitions. The MAX213E's receiver inputs have approximately 0.5 V hysteresis, except in shutdown, when receivers R4 and R5 have no hysteresis.
When entering shutdown with receivers active, R4 and R5 are not valid until $80 \mu$ s after SHDN is driven low. When coming out of shutdown, all receiver outputs are invalid until the charge pumps reach nominal voltage levels (less than $2 m s$ when using $0.1 \mu \mathrm{~F}$ capacitors).
+15kV ESD Protection
As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs have extra protection against static electricity. Maxim's engineers developed state-of-the-art structures to protect these pins against ESD of $\pm 15 \mathrm{kV}$ without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing RS-232 products can latch and must be powered down to remove latchup.
ESD protection can be tested in various ways; the transmitter outputs and receiver inputs of this product family are characterized for protection to the following limits:

1) $\pm 15 \mathrm{kV}$ using the Human Body Model
2) $\pm 8 \mathrm{kV}$ using the contact-discharge method specified in IEC1000-4-2
3) $\pm 15 \mathrm{kV}$ using IEC1000-4-2's air-gap method.

## ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test set-up, test methodology, and test results.

## Human Body Model

Figure 6a shows the Human Body Model, and Figure 6 b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100 pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a $1.5 \mathrm{k} \Omega$ resistor.

## MAX202E-MAX213E, MAX232E/MAX241E土15kV ESD-Protected, +5V RS-232 Transceivers

Figure 6a. Human Body ESD Test Model

Figure 7a. IEC1000-4-2 ESD Test Model

IEC1000-4-2
The IEC1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX202E/MAX203E-MAX213E, MAX232E/MAX241E help you design equipment that meets level 4 (the highest level) of IEC1000-4-2, without the need for additional ESD-protection components.
The major difference between tests done using the Human Body Model and IEC1000-4-2 is higher peak current in IEC1000-4-2, because series resistance is lower in the IEC1000-4-2 model. Hence, the ESD withstand voltage measured to IEC1000-4-2 is generally lower than that measured using the Human Body Model. Figure 7b shows the current waveform for the 8 kV IE ${ }^{-}$- 0 -4-2 level-four ESD contact-discharge test.

Figure 6b. Human Body Model Current Waveform

Figure 7b. IEC1000-4-2 ESD Generator Current Waveform
The air-gap test involves approaching the device with a charged probe. The contact-discharge method connects the probe to the device before the probe is energized.

## Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. Of course, all pins require this protection during manufacturing, not just RS-232 inputs and outputs. Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

# MAX202E-MAX213E, MAX232E/MAX241E土15kV ESD-Protected, +5V RS-232 Transceivers 

## Applications Information

## Capacitor Selection

The capacitor type used for C1-C4 is not critical for proper operation. The MAX202E, MAX206-MAX208E, MAX211E, and MAX213E require $0.1 \mu \mathrm{~F}$ capacitors, and the MAX232E and MAX241E require $1 \mu \mathrm{~F}$ capacitors, although in all cases capacitors up to $10 \mu \mathrm{~F}$ can be used without harm. Ceramic, aluminumelectrolytic, or tantalum capacitors are suggested for the $1 \mu \mathrm{~F}$ capacitors, and ceramic dielectrics are suggested for the $0.1 \mu \mathrm{~F}$ capacitors. When using the minimum recommended capacitor values, make sure the capacitance value does not degrade excessively as the operating temperature varies. If in doubt, use capacitors with a larger (e.g., $2 x$ ) nominal value. The capacitors' effective series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on $V+$ and V -
Use larger capacitors (up to $10 \mu \mathrm{~F}$ ) to reduce the output impedance at $\mathrm{V}_{+}$and V -. This can be useful when "stealing" power from V+ or from V-. The MAX203E and MAX205E have internal charge-pump capacitors.
Bypass Vcc to ground with at least $0.1 \mu \mathrm{~F}$. In applications sensitive to power-supply noise generated by the charge pumps, decouple VCC to ground with a capacitor the same size as (or larger than) the chargepump capacitors (C1-C4).

## V+ and V- as Power Supplies

A small amount of power can be drawn from V+ and V-, although this will reduce both driver output swing and noise margins. Increasing the value of the charge-pump capacitors (up to $10 \mu \mathrm{~F}$ ) helps maintain performance when power is drawn from $\mathrm{V}+$ or V -.

Driving Multiple Receivers Each transmitter is designed to drive a single receiver. Transmitters can be paralleled to drive multiple receivers.

## Driver Outputs when Exiting Shutdown

The driver outputs display no ringing or undesirable transients as they come out of shutdown.

## High Data Rates

These transceivers maintain the RS-232 $\pm 5.0 \mathrm{~V}$ minimum driver output voltages at data rates of over 120 kbps . For data rates above 120 kbps , refer to the Transmitter Output Voltage vs. Load Capacitance graphs in the Typical Operating Characteristics. Communication at these high rates is easier if the capacitive loads on the transmitters are small; i.e., short cables are best.

## Table 2. Summary of EIA/TIA-232E, V. 28 Specifications

| PARAMETER |  | CONDITIONS | EIA/TIA-232E, V. 28 SPECIFICATIONS |
| :---: | :---: | :---: | :---: |
